Introduction

A new stadium project (NSP) is being constructed to replace the current Georgia Dome in Downtown Atlanta, Georgia. The new stadium will host Atlanta Falcons football games and other large events beginning in 2017. The NSP site will be located south of the existing Georgia Dome stadium, bounded by Northside Drive to the west, Centennial Olympic Parkway to the east, Mitchell Street to the south and the existing Georgia Dome to the north. In order to accommodate the large footprint of the NSP site south of the existing Georgia Dome, several major roadway and intersection improvements need to be made, including realignments of both Martin Luther King Jr. (MLK) Boulevard and Mangum Street, and the reconfiguration of several intersections surrounding the NSP site. This traffic study was conducted to evaluate the impact of the proposed roadway realignments and intersection reconfigurations.

Scope of Traffic Study

This study identifies the roadway and intersection improvements needed to accommodate the proposed NSP. The study evaluated intersection and roadway improvements needed to support current and future weekday commuter peak hour traffic and does not include an evaluation of event management plans and operations. A Traffic Management Plan (TMP) is being prepared separately that will evaluate traffic operations during events at the new stadium and will make additional recommendations for improvements and update management plans as needed.

The traffic analysis was conducted in cooperation with both the City of Atlanta (City) and the Georgia Department of Transportation (GDOT), and the methodology and findings are in accordance with City and GDOT standards and guidelines.

Study Area

The study included all roadways and intersections potentially impacted by the site, including the following intersections:

1. MLK at Tatnall Street (signalized)
2. MLK at Walnut Street (signalized)
3. MLK at Northside Drive (signalized)
4. Mitchell at Northside Drive (signalized)
5. MLK at Centennial Olympic (signalized)
6. MLK at Spring Street (signalized)
7. Mitchell at Spring Street (signalized)
8. Mitchell at Mangum Street (unsignalized)
9. Mitchell at Walnut Street (unsignalized)

Existing traffic counts at these 9 intersections were collected on typical weekday morning (AM) and afternoon (PM) peak period, in the hours between 6:30 AM to 9:00AM and 4:30PM and 6:30PM respectively, during the first two weeks of October 2013. The raw traffic data collected is included in Appendix A at the conclusion of this report. The AM and PM existing peak hour intersection volumes for each intersection are summarized in Figure 1, attached at the end of the report.

Average Daily Traffic (ADT) counts were also collected at four locations during a four-day period (to capture both a weekday and weekend ADT volume without a football game at the Georgia Dome) during the first week of October 2013 at the following locations in the study area:

- MLK east of Northside Drive
- Mitchell Street east of Mangum Street
- MLK west of Northside Drive
- Mitchell Street west of Northside Drive

The raw ADT counts are included in **Appendix A** and also summarized in **Figure 1**.

Existing Conditions Analysis

Current traffic conditions were analyzed at the 9 study area intersections based on the count data collected, current roadway geometry, and existing traffic signal timings. The intersection analyses were conducted using SYNCHRO traffic analysis software, which uses Highway Capacity Manual (HCM) methodologies and formulas to determine the average delay and intersection LOS rating for each intersection during peak hour conditions. The existing conditions Synchro analysis is included in **Appendix B** and summarized in **Table 1** below.

Table 1: Existing Conditions Intersection Analysis Summary (Synchro v8.01)

Intersection	2013 Existing Conditions	
	AM Peak	PM Peak
MLK at Tatnall Street	0.0 / A	0.0 / A
MLK at Walnut Street	13.9 / B	14.3 / B
MLK at Northside Drive	39.2 / D	26.1 / C
Mitchell at Northside Drive	9.0 / A	5.6 / A
MLK at Centennial Olympic	42.1 / D	34.4 / C
MLK at Spring Street	34.6 / C	43.8 / D
Mitchell at Spring Street	13.9 / B	26.5 / C
Mitchell at Mangum Street	A / A	A / A
Mitchell at Walnut Street	A / A	A / A

Legend: for signalized intersections: 0.0 / X = Average Intersection Delay / LOS;
for unsignalized intersections: X / X = overall / worst movement LOS

In urban areas, the City and GDOT set a standard to achieve an overall intersection LOS grade of LOS C or better in defining acceptable intersection operating conditions during the AM and PM peak hours; however, many intersections operate at LOS D without causing undue congestion and/or warranting geometric or signalization improvements. The 2013 existing conditions analysis shows that all intersections are operating at acceptable LOS grades during the AM and PM peak periods, except the MLK at Northside Drive intersection in the AM peak hour and the MLK at Spring Street intersection in the PM peak hour, when both these intersections operate at LOS D. However, peak hour field observations at these intersections showed no excessive congestion or signal failures to exist at either of these intersections and no improvements are planned or warranted.

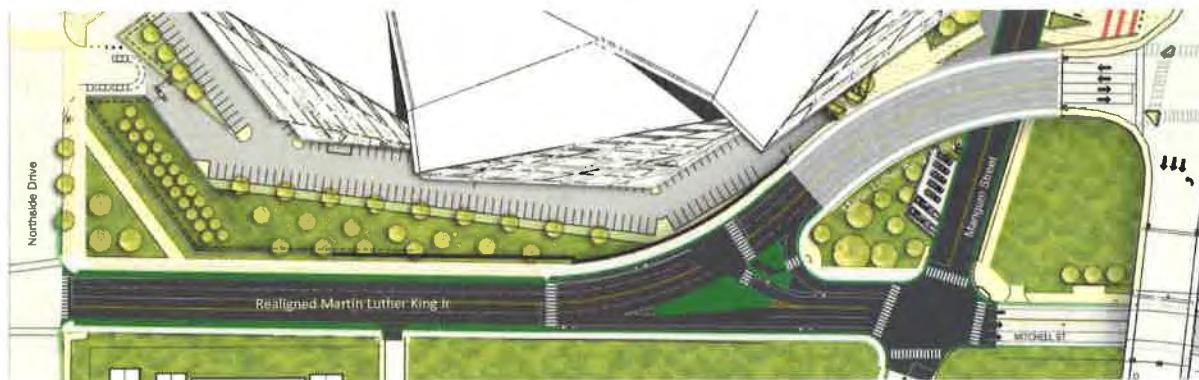

Proposed Changes in Street Network

In order to accommodate the large footprint of the NSP site south of the existing Georgia Dome, several major roadway and intersection improvements needed to be made.

Realignment of MLK

MLK Boulevard must be realigned across the NSP site, beginning at its intersection with Centennial Olympic Parkway west to where it intersects Northside Drive. MLK will be realigned to the south and share an alignment with the current Mitchell Street and form the southern roadway boundary to the NSP site. This relocated “New MLK” will have a total of four lanes (two in each direction) from Centennial Olympic Parkway to Northside Drive. A schematic of the proposed realignment Plan is included in **Figure 2**.

Figure 2: MLK Realignment Concept

Realignment of Mangum Street

The current Mangum Street alignment between Georgia Dome Drive and Mitchell Street will be realigned slightly to the east but maintain its current intersection location at Mitchell Street, just east of where Mitchell Street will intersect New MLK at a signalized T-intersection. In addition, Mangum Street is to become privately owned and part of the stadium site. The intersection of Mangum and Mitchell Street will serve as an important pedestrian and bicycle connection from Mitchell Street to the new stadium plaza, and the intersection design will promote safe pedestrian and bicycle crossings of both New MLK and Mitchell Streets. This intersection also serves as a "gateway" entrance to the stadium area from the east and will be part of the MLK bicycle plan across the NSP site.

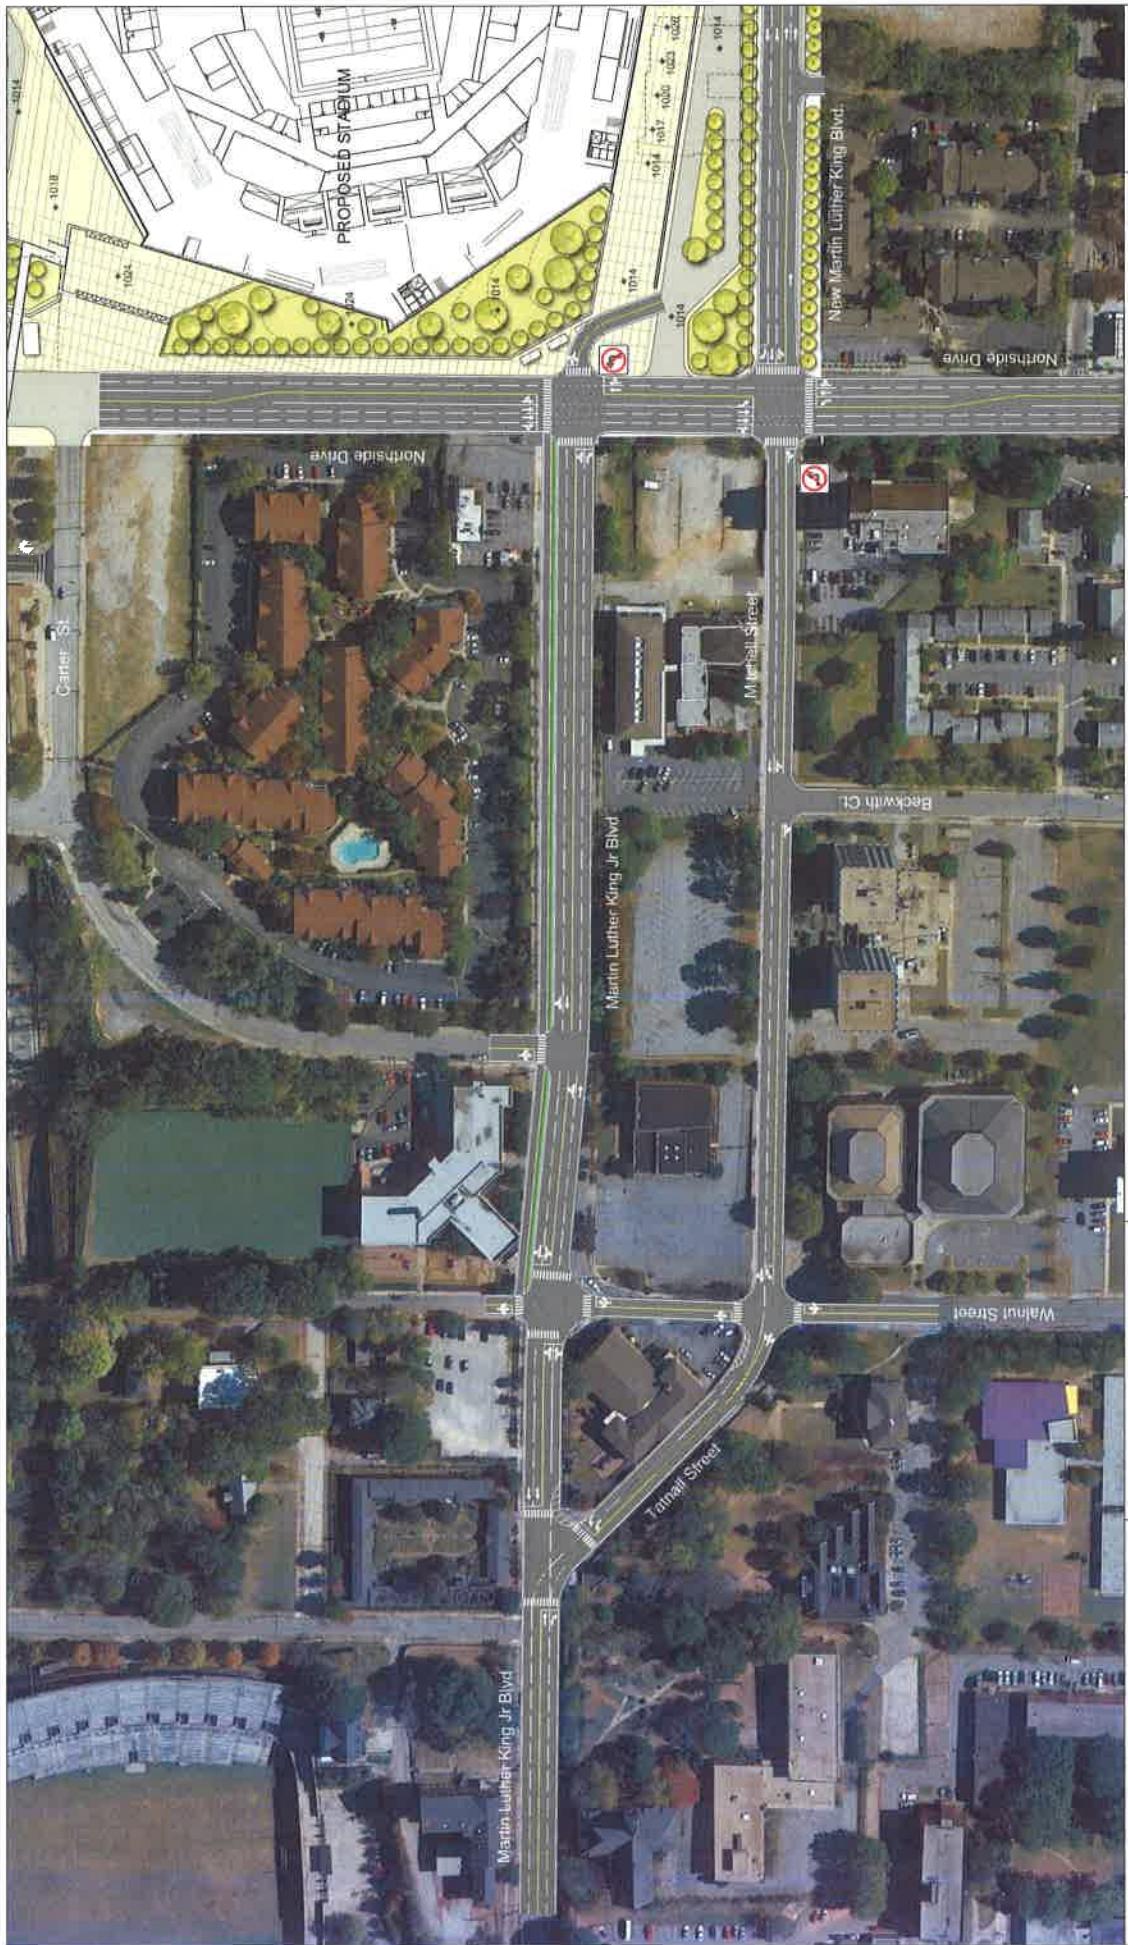

Northside Drive Intersections

The closure of existing MLK east of Northside Drive required a reconfiguration of the Northside Drive intersection with Mitchell Street / New MLK. While the four-lane New MLK approaching Northside Drive is fixed, many alternatives were considered that evaluated how to both maintain east-west traffic flow into and out of downtown and the local connectivity of the Vine City neighborhood using the current or proposed streets west of Northside Drive. A separate document was prepared that detailed the 17 alternatives studied. That document also details the several month study process by which the City and GDOT selected a preferred roadway concept. The preferred alternative, referred to as Alternative 6C, is included as Figure 3.

The preferred alternative includes restriping lanes on Mitchell Street west of Northside Drive to align with the proposed New MLK lanes east of Northside Drive. The restriping also includes the conversion of Tatnall Street from a one-way eastbound to a two-way street (one lane in each direction) so that westbound traffic on Mitchell Street can rejoin westbound MLK via Tatnall Street. The six lanes on existing MLK between Northside and Tatnall Street will be reduced to four lanes to accommodate bike lanes and improved pedestrian space. Also, the northbound left turn from Northside Drive destined for existing MLK Boulevard will be directed to turn left at Mitchell Street to then connect to MLK Boulevard west of Tatnall Street. Through traffic on eastbound MLK Boulevard will use Tatnall to Mitchell Street and cross Northside Drive to connect with New MLK; however, eastbound MLK Boulevard traffic destined to turn right or left at Northside Drive will be directed to stay on MLK Boulevard to turn right or left onto Northside Drive.

Mitchell/Mangum Intersection

The intersection of Mitchell Street at Mangum Street currently has two-way (minor street) stop control, where Mangum Street has a stop sign control while Mitchell Street does not stop. Under the MLK Boulevard realignment plan, the intersection geometry at this intersection remains largely unchanged; however, traffic volumes would be slightly higher on Mitchell Street during commuter peak periods.

FIGURE 3:
Preferred MLK Concept
West of Nortside Drive

1/10/2014

Because of the higher projected volumes on Mitchell Street, a traffic signal warrant analysis was performed at this intersection according to the Manual of Uniform Traffic Control Devices (MUTCD) standards. However, the peak hour volumes are not high enough to meet MUTCD warrant 3 in either current or future conditions. Intersection operating conditions show acceptable delay and the highest LOS grade (LOS A) under current and future conditions.

Some concerns have been expressed about safety for vehicles turning from Magnum Street onto Mitchell Street. Additional studies will be conducted to determine if the crash rate for this intersection meets safety warrants for a signal, and if geometric changes can be made to mitigate any existing crash problems at this intersection.

Future Conditions Analysis

Background Growth Rate

To determine future weekday peak hour intersection operations, a future growth rate was determined based on historic growth rates on the roadways in the vicinity of the NSP site. Historic traffic volumes were collected for the roadways adjacent to the NSP site and the results were compiled in a table included in **Appendix C**. The results show that the ADT volumes on all roadways except Northside Drive north of MLK declined over the past 10 years. However, a continued negative growth rate is not consistent with the redevelopment of the NSP site, and to account for this potential background growth, a growth rate of 2-percent per year was assumed for all roadways surrounding the NSP site. This 2-percent rate was applied to the existing intersection and roadway volumes over a four-year construction period to determine Opening Year (2017) traffic volumes for analysis. The 2017 No-Build AM and PM peak hour intersection volumes for each studied intersection are summarized in **Figure 4**, attached at the end of the report.

2017 No-Build and Build Operations Analysis

The 2017 volumes were analyzed under No-Build conditions, which assume no stadium site and no changes to the existing roadway network, using the same methodology and Synchro analysis used to evaluate existing conditions. The 2017 No-Build conditions Synchro analysis results are included in Appendix B and summarized in **Table 2** below.

Table 2: Opening Year (2017) Build and No-Build Intersection Analysis Summary (Synchro v8.01)

Intersection	Signal Control	2017 No-Build		2017 Build	
		AM Peak	PM Peak	AM Peak	PM Peak
MLK at Tatnall Street	Signalized	0.0 / A	0.0 / A	12.3 / B	21.5 / C
MLK at Walnut Street	Signalized	17.8 / B	15.1 / B	19.3 / B	24.0 / C
MLK at Northside Drive	Signalized	31.7 / C	33.8 / C	13.9 / B	12.2 / B
Mitchell at Northside Drive	Signalized	11.5 / B	6.6 / A	39.8 / D	40.3 / D
Mitchell Street at New MLK	Unsig/Signal	A / A	A / B	6.0 / A	8.0 / A
MLK at Centennial Olympic	Signalized	28.7 / C	43.4 / D	29.6 / C	29.4 / C
MLK at Spring Street	Signalized	30.7 / C	42.2 / D	38.0 / C	33.6 / C
Mitchell at Spring Street	Signalized	13.3 / B	25.5 / C	12.4 / B	26.1 / C
Mitchell at Mangum Street	Unsignalized	A / A	A / A	A / A	A / A
Mitchell at Walnut Street	Unsignalized	A / A	A / A	B / B	B / B

Legend: for signalized intersections: 0.0 / X = Average Intersection Delay / Level of service; for unsignalized intersections: X / X = overall / worst movement LOS

The same 2017 No-Build volumes were reassigned to the roadway network assuming the realigned roadways and reconfigured intersections identified in the preferred Build alternative. In addition, the NSP site will contain a small parking lot (less than 150 spaces) on the south side of the site that will be controlled by gates on a driveway connection to Northside Drive immediately opposite existing MLK Boulevard at the signalized intersection. This parking will serve VIP and business office staff, and trips generated were assumed as new trips to this intersection and included in the intersection volumes for analysis. The 2017 Build AM and PM peak hour intersection volumes for each studied intersection are summarized in **Figure 5**, attached at the end of the report.

The 2017 Build conditions were analyzed using the same methodology and Synchro processes used to evaluate existing and No-Build conditions, and the Synchro analysis results are included in Appendix B and summarized and compared to the 2017 No-Build analysis results in Table 2 below. The analysis results show that 2017 Opening Year operations at the study area intersections will operate with acceptable delay and LOS grade for the AM and PM commuter peak periods.

2017 Build VISSIM Operational Analysis

Because of the closely-spaced MLK and Mitchell Street intersections on Northside Drive (that limits queue storage) and the regional importance of Northside Drive, the design team analyzed 2017 Build operations at both Northside Drive intersections using VISSIM, a microsimulation traffic evaluation software package that is better suited to evaluate queuing, vehicle weaving and closely spaced signal interactions in an urban roadway network. The VISSIM microsimulation analysis was conducted according to GDOT guidelines and submitted for their review and concurrence of the results. The VISSIM analytical results, summarized in a table in **Appendix D**, showed that both the overall intersections and individual intersection approached will operate at LOS D or better under 2017 Opening Year Build conditions. Further VISSIM animation results, illustrated by a screen capture in **Figure 6**, showed that the signals can indeed be coordinated and provide sufficient capacity and queue storage so that no excessive congestion or signal failures were observed over the AM or PM peak hour periods.

Figure 6: Screen Capture of 2017 Build VISSIM Model Animation

Design Horizon Operational Analysis

For analysis of the roadway network and intersection configurations beyond the 2017 opening year, an annual growth rate of 1-percent per year was used to project potential roadway and operating conditions through a 10-year design horizon after the opening of the NSP (2027). No other roadway improvements were assumed in the design horizon analysis, and signal timings were optimized based on future design year volumes. The 2027 design horizon condition was analyzed using the same methodology and Synchro analysis procedures used to evaluate existing, No-Build and Build conditions, and the Synchro analysis results are included in **Appendix B** and summarized in **Table 3** below. The analysis results show that the roadways and intersections will continue to operate at LOS D or better through the 2027 design horizon without the need for additional roadway or intersection improvements.

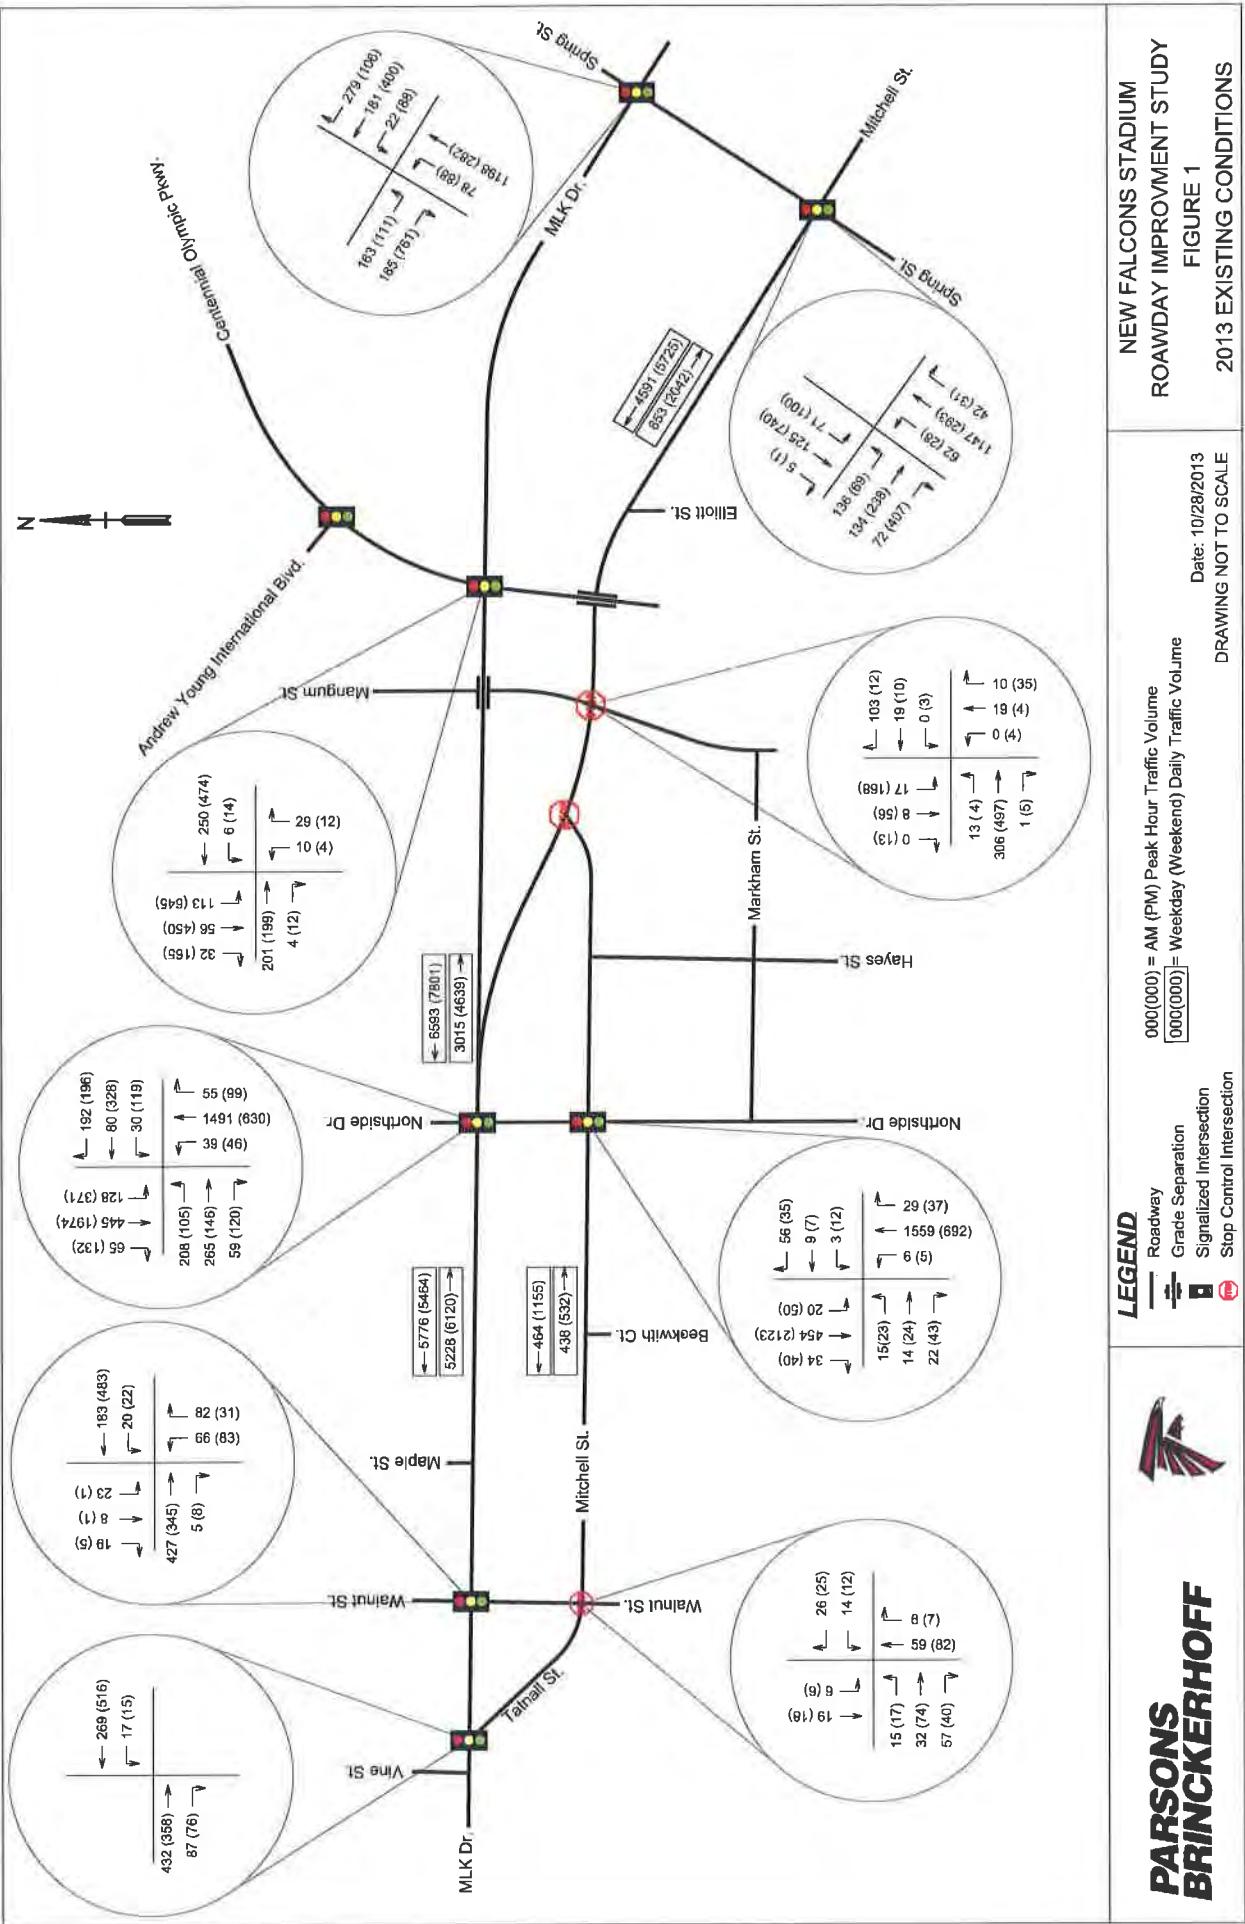

Table 3: 2027 Design Horizon Intersection Analysis Summary (Synchro v8.01)

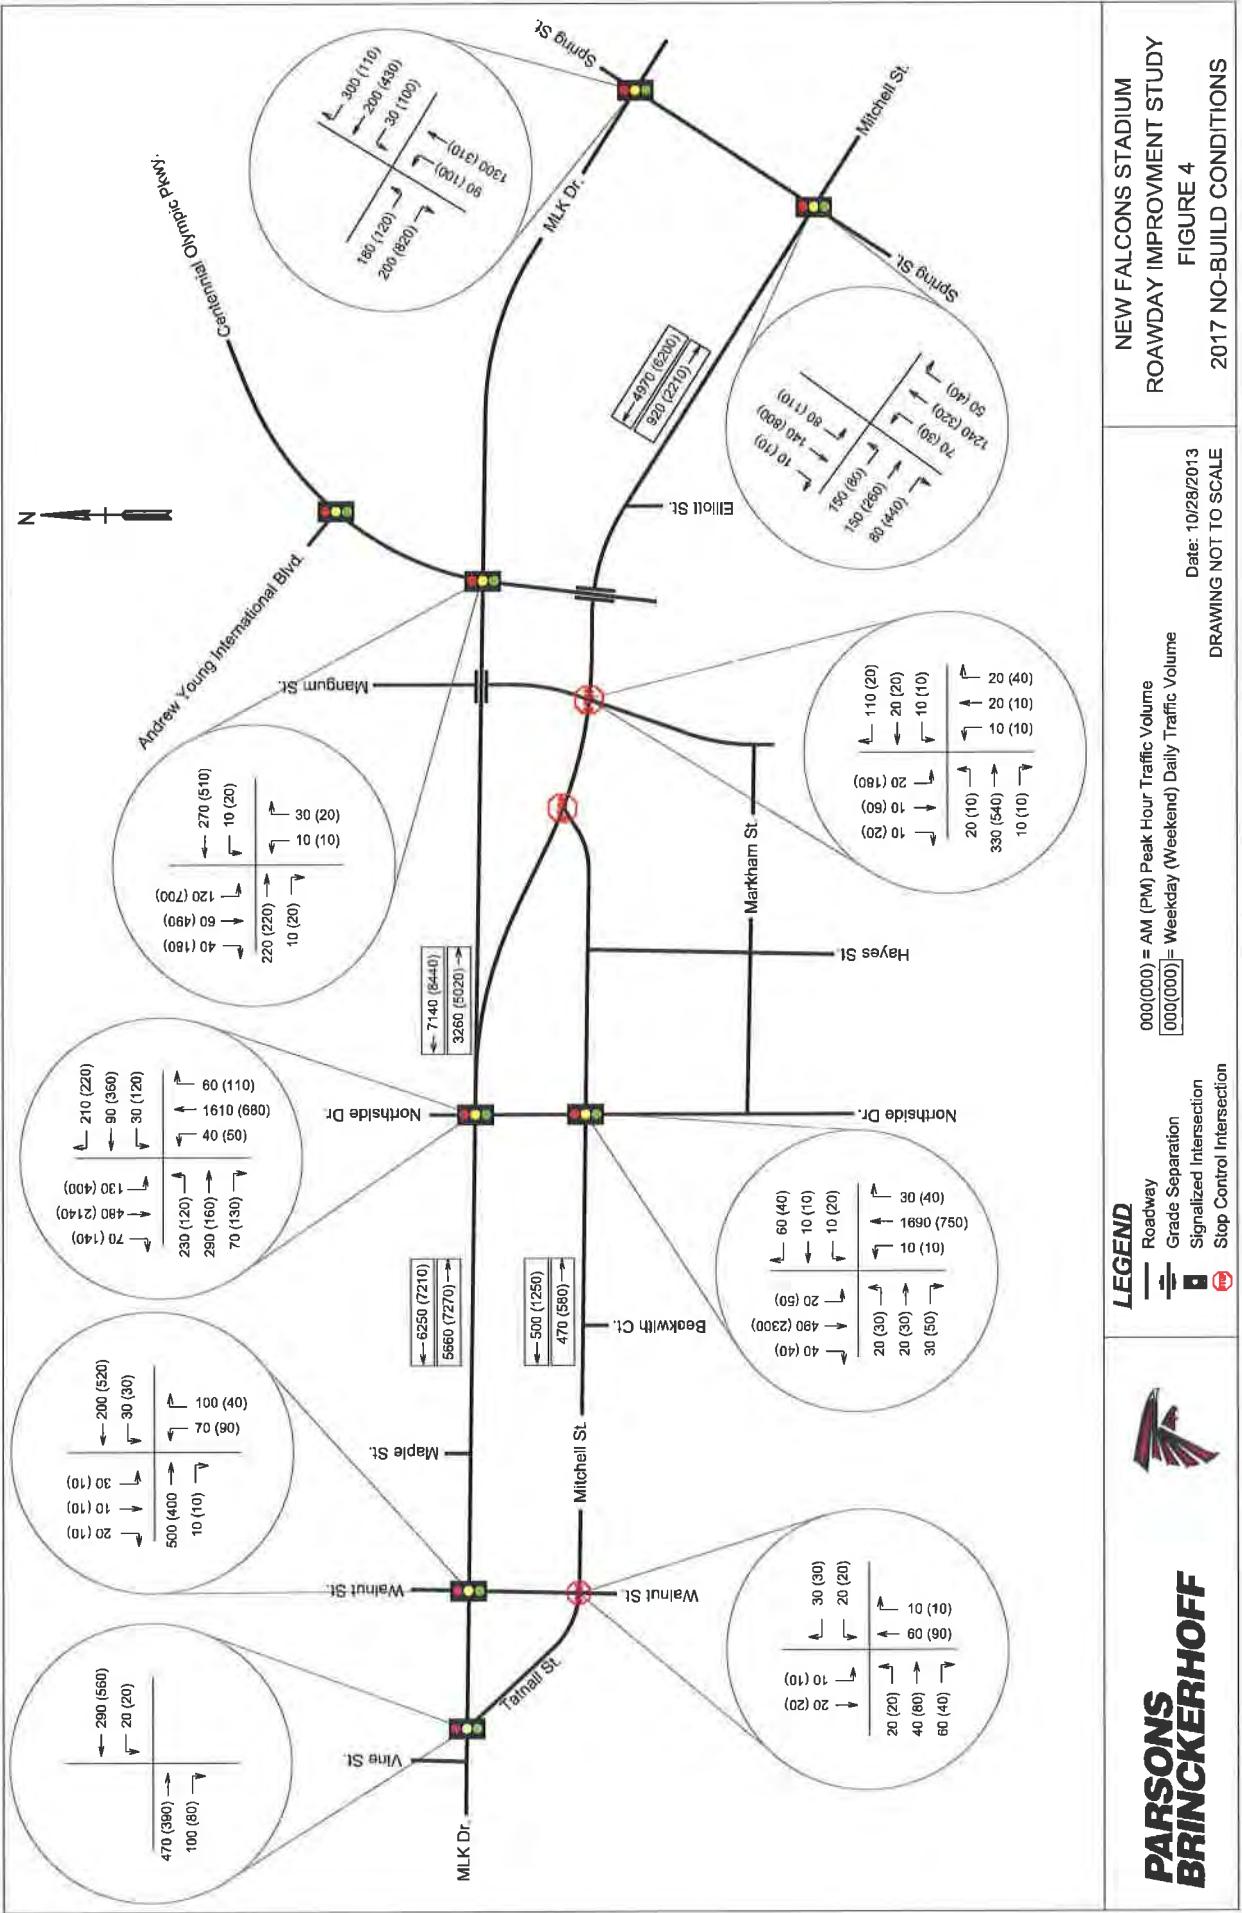

Intersection	2027 Design Horizon Conditions	
	AM Peak	PM Peak
MLK at Tatnall Street	12.4 / B	23.6 / C
MLK at Walnut Street	19.5 / B	17.9 / B
MLK at Northside Drive	9.9 / A	16.4 / B
Mitchell at Northside Drive	53.8 / D	53.3 / D
Mitchell at New MLK	5.9 / A	8.8 / A
MLK at Centennial Olympic	30.2 / C	28.7 / C
MLK at Spring Street	41.4 / D	39.7 / D
Mitchell at Spring Street	13.6 / B	24.2 / C
Mitchell at Mangum Street	A / A	A / A
Mitchell at Walnut Street	A / A	A / A

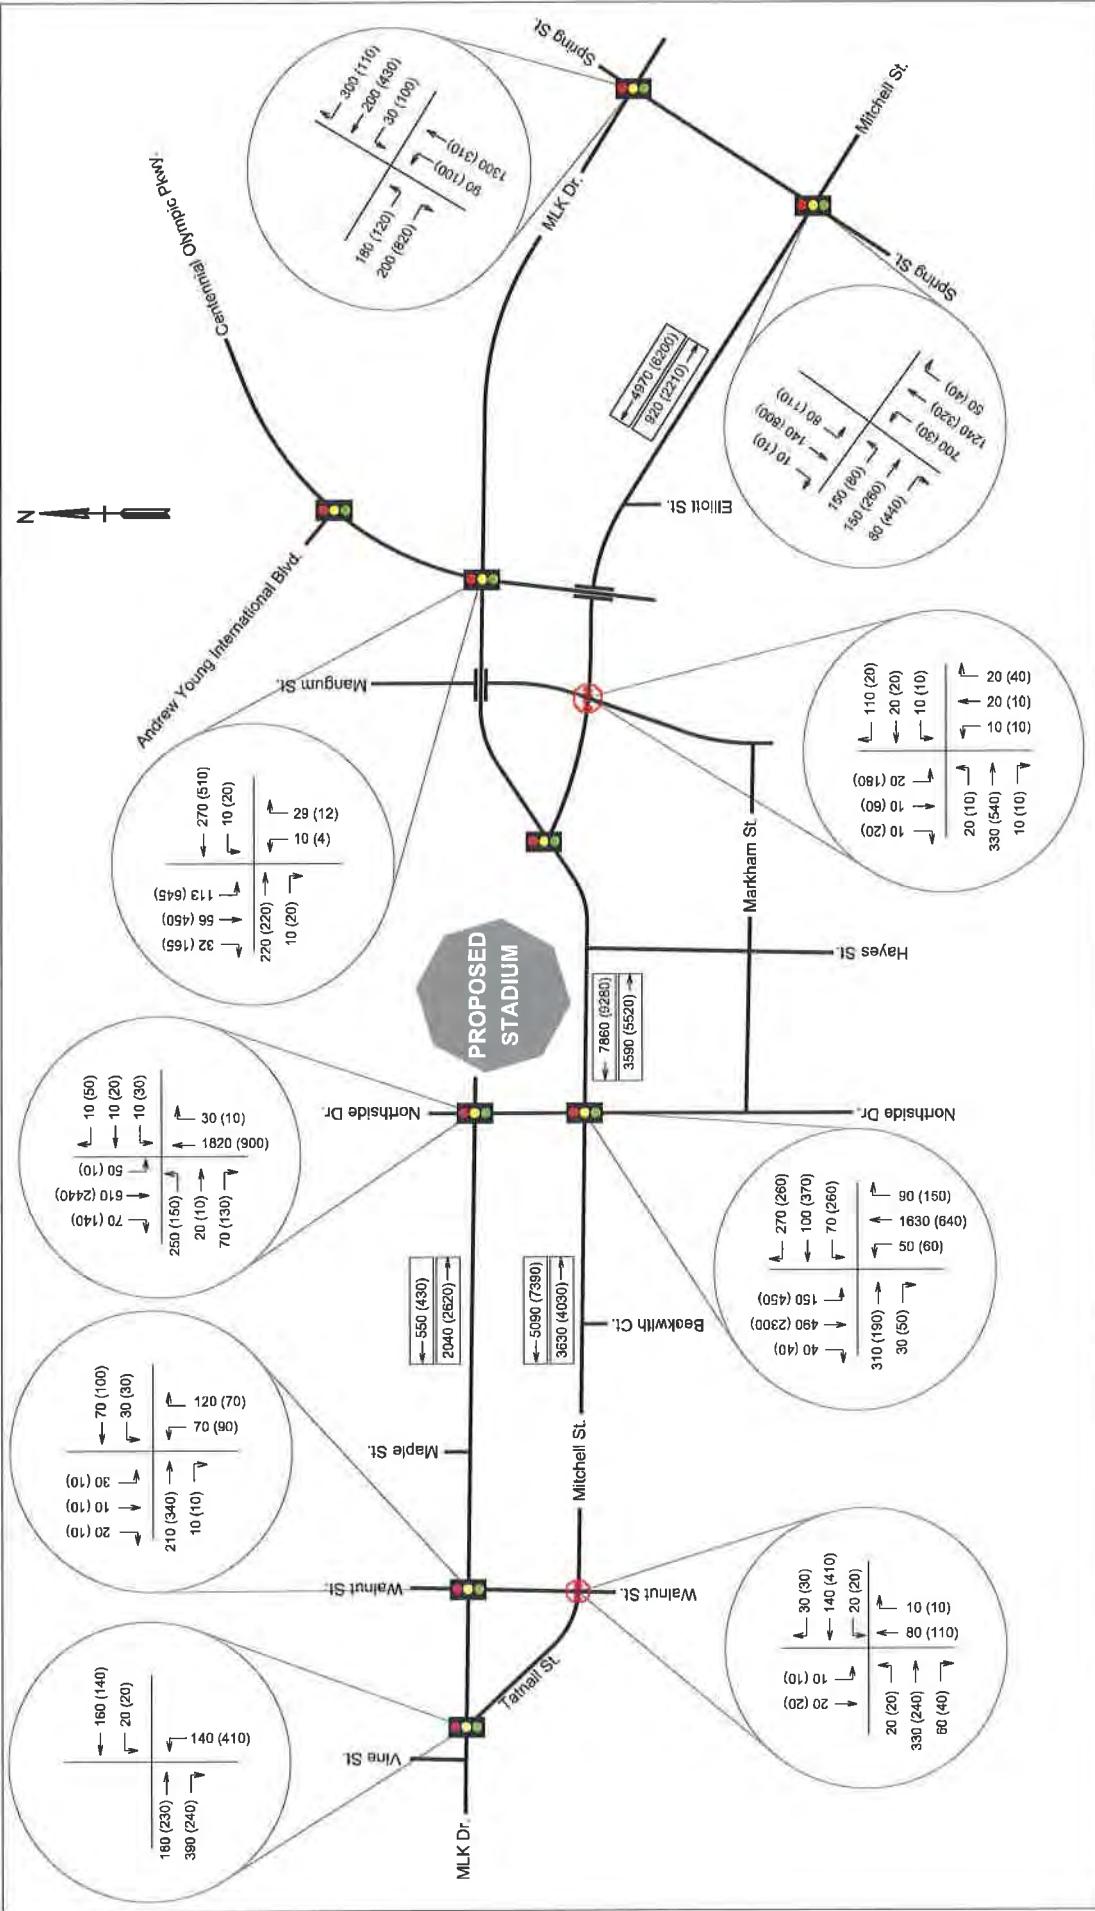

Legend: for signalized intersections: 0.0 / X = Average Intersection Delay / LOS;
for unsignalized intersections: X / X = overall / worst movement LOS

Conclusion

Detailed traffic and microsimulation analysis of the proposed Build Alternative roadway realignments and intersection reconfigurations provide adequate AM and PM peak hour roadway and intersection operations to accommodate the proposed NSP site. The intersections on Northside Drive will operate at LOS C or better in the opening year and will operate at LOS D or better through the 2017 design year horizon.
