STATE OF GEORGIA **COUNTY OF FULTON**

RESOLUTION NO. 15-07-344

A RESOLUTION SUPPORTING THE TRANSMITTAL OF A DRAFT CAPITAL IMPROVEMENTS ELEMENT TO THE ATLANTA REGIONAL COMMISSION FOR REGIONAL AND STATE REVIEW AS REQUIRED FOR THE CONSIDERATION OF AN **IMPACT FEE PROGRAM**

WHEREAS, the City of Milton has prepared a draft Capital Improvements Element to be incorporated into and update the Milton 2030 Comprehensive Plan (a copy of which is attached hereto as Exhibit "A"); and

WHEREAS, the draft Capital Improvements Element was prepared in accordance with the "Development Impact Fee Compliance Requirements" and the "Minimum Standards and Procedures for Local Comprehensive Planning" adopted by the Department of Community Affairs pursuant to the Georgia Planning Act of 1989; and,

WHEREAS, a duly advertised public hearing was held on May 4, 2015, at 6:00 P.M. in the Milton City Hall in accordance with Section (3)(a) of Chapter 110-12-2-.04 (Procedural Requirements) of the Development Impact Fee Compliance Requirements chapter of the Georgia Administrative Code; and

WHEREAS, a second duly advertised public hearing was held on July 20, 2015, at 6:00 P.M. in the Milton City Hall in accordance with Section (3)(b) of Chapter 110-12-2-.04 (Procedural Requirements) of the Development Impact Fee Compliance Requirements chapter of the Georgia Administrative Code:

NOW, THEREFORE BE IT RESOLVED, that the Mayor and City Council of the City of Milton do hereby approve transmission of the attached draft Capital Improvements Element to the Atlanta Regional Commission for Regional and State review, in accordance with the requirements of the Development Impact Fee Compliance Requirements chapter of the Georgia Administrative Code.

RESOLVED this 20th day of July, 2015.

Joe Lockwood, Mayor

Attest:

Sudie AM Gordon, City Clerk

Capital Improvements Element

City of Milton Impact Fee Program

Including the following public facility categories:

Parks and Recreation Fire Protection Law Enforcement Road Improvements

Introduction

The purpose of a Capital Improvements Element (CIE) is to establish where and when certain new capital facilities will be provided within a jurisdiction and the extent to which they may be financed through an impact fee program. This Capital Improvements Element addresses parks & recreation, fire protection, law enforcement and road improvements.

As required by the Georgia Development Impact Fee Act ("State Act" of "DIFA"), and defined by the Department of Community Affairs in its *Development Impact Fee Compliance Requirements*, the CIE must include the following for each capital facility category for which an impact fee will be charged:

- a **projection of needs** for the twenty-year planning period to 2035;
- the designation of **service areas**—the geographic area in which a defined set of public facilities provide service to development within the area;
- the designation of levels of service (LOS)—the service level that is being and will be provided;
- a **schedule of improvements** listing impact fee related projects and costs for the twentyyear planning period;
- a description of **funding sources** for the twenty-year planning period.

Additionally, in accordance with the State Act and DCA's *Development Impact Fee Compliance Requirements*, a policy statement regarding potential impact fee exemptions is included in this CIE if the City wishes to adopt or apply such exemptions in the future.

Impact Fees Authorized

Impact fees are authorized in Georgia pursuant to O.C.G.A. §36-71-1 et seq., the *Georgia Development Impact Fee Act* (DIFA), and are administered by the Georgia Department of Community Affairs pursuant to Chapter 110-12-2, *Development Impact Fee Compliance Requirements*, of the Georgia Administrative Code. Under DIFA, the City can collect money from new development based on that development's proportionate share—the 'fair share'—of the cost to provide the facilities needed specifically to serve new development. This includes the categories of roads, public safety and parks. Revenue for such facilities can be produced from new development in two ways: through future taxes paid by the homes and businesses that growth creates, and through an impact fee assessed as new development occurs.

Categories for Assessment of Impact Fees

To assist in paying for the high costs of expanding public facilities and services to meet the needs of projected growth and to ensure that new development pays a reasonable share of the costs of public facilities, Milton is considering the establishment of impact fees for parks & recreation, fire protection, law enforcement and road improvements. The chapters in this Capital Improvements Element provide population and employment forecasts and detailed information regarding the inventory of current facilities, the level of service, and detailed calculations of project costs and the impact of new growth and development for the specific public facilities.

The following table shows the facility categories being considered by the City that are eligible for impact fee funding under DIFA and that are considered in this report. The service area for each public facility category—that is, the geographical area served by the facility category—is also given, along with what the standard adopted as the level of service to be delivered for each facility category is based upon.

Overview of Impact Fee Program Facilities

	Parks and Recreation	Fire Protection	Law Enforcement	Road Improvements
Eligible Facilities	Park acres, recreation components (ballfields, etc.) and trails	Fire stations, fire trucks & general vehicles	Administrative facility space	Road projects serving Milton residents and workers
Service Area	Citywide	Citywide	Citywide	Citywide
Level of Service Standard Based on	Number of acres, components and trail miles per dwelling unit	Square footage and number of vehicles per day/night population	Square footage of facilities per day/night population	LOS "D" for entire road network
Historic Funding Source(s)	General Fund	General Fund	General Fund	General Fund

Terms used in the **Overview Table**:

Eligible Facilities under the State Act are limited to capital items having a life expectancy of at least ten years, such as land, buildings and certain vehicles. Impact fees cannot be used for the maintenance, supplies, personnel salaries, or other operational costs, or for short-term capital items such as computers, furniture or most automobiles. None of these costs are included in the impact fee system.

Service Areas are the geographic areas that the facilities serve, and the areas within which the impact fee can be collected. Monies collected in a service area for a particular category may only be spent for that purpose, and only for projects that serve that service area.

Level of Service Standards are critical to determining new development's fair share of the costs. The same standards must be applied to existing development as well as new to assure that each is paying only for the facilities that serve it. New development cannot be required to pay for facilities at a higher standard than that available to existing residents and businesses, nor to subsidize existing facility deficiencies.

Funding Sources for capital improvements have historically been General Fund tax collections, net of any grants received (if any). Impact fees will be used to fund all or a portion of eligible impact fee costs. Tax collections include the City's normal annual property tax levy and any special levies for debt instruments (such as bonds) that are intended to provide funding for impact fee projects in whole or in part.

Editorial Conventions

This report observes the following conventions:

The capitalized word 'City' applies to the government of Milton, the City Council or any of its departments or officials, as appropriate to the context. An example is "the City has adopted an impact fee ordinance".

The lower case word 'city' refers to the geographical area of Milton, as in "the population of the city has grown".

The same conventions are applied to the words 'County' and 'county', 'State' and 'state'.

Single quote marks (' and ') are used to highlight a word or phrase that has a particular meaning or refers to a heading in a table.

Double quote marks (" and ") are used to set off a word or phrase that is a direct quote taken from another source, such as a passage or requirement copied directly from a law or report.

Numbers shown on tables are often rounded from the actual calculation of the figures for clarity, but the actual calculated number of decimal points is retained within the table for accuracy and further calculations.

Forecasts

In order to accurately calculate the demand for future services in Milton, new growth and development must be quantified in future projections. These projections include forecasts for population, households, housing units, and employment to the year 2035. These projections provide the baseline conditions from which the current Level of Service calculations are produced. Also, projections are combined to produce what is known as 'day/night population.' This is a method that combines resident population and employees in a service area to produce an accurate picture of the total number of persons that rely on certain 24-hour services, such as fire protection. The projections used for each public facility category are specified in each public facility chapter.

This chapter presents a summary of the forecasts that have been identified as the most appropriate for Milton, based on a wide-ranging analysis of alternate approaches that were considered for their reasonableness and correlation to the City's growth policies contained in its 2030 Comprehensive Plan, adopted in 2011.

Regional Setting

Continuing past trends, Milton is expected to continue to grow at a faster pace than its immediate neighbors with regard to population, housing and jobs. Its neighbors—Alpharetta and John's Creek— contain the preponderance of population and housing units in the 3-city N. Fulton Superdistrict, but are expected to grow collectively at a slower pace than Milton (increasing 49% to Milton's 71% in population and 54% to Milton's 71% in housing between 2014 and 2035). Over the coming twenty years, the city is expected to increase its share of all residents among the three cities from 20% to 22%, and grow from 18% to 20% of all housing units. Numerically, Alpharetta and Johns Creek will continue to dominate employment in the area, adding 21,704 new jobs by 2035 compared to Milton's job increase of 5,500, although this 'modest' growth will increase Milton's share of area employment from 7% to almost 10%.

ARC's N Fulton Superdistrict includes Milton along with Alpharetta and John's Creek. Superdistrict projections interpolated by ROSS+associates.

Population and Housing Unit Forecasts

Table 1 presents the forecasts for population for each year from 2014 to 2035 and provides the forecasts for households and housing units over the same period. The figures shown are, in essence, mid-year estimates reflecting Census Bureau practice. In other words, the increase in population between 2014 and 2035 would actually be from July 1, 2014 to June 30, 2035.

The population forecasts represent a projection of the annual population figures reported by the Census Bureau through 2013. The number of households is calculated based on the most recently reported average household size in the city, and divided into the population forecasts. Since households are synonymous with 'occupied housing units', the total number of housing units is calculated by applying an occupancy rate to account for vacant units. In essence, the city will be 'built-out' as to its capacity to accommodate future residential development under current land use and conservation policies and zoning provisions.

	Milton Population	Households	Housing Units	Jobs
2014	36,060	12,872	13,611	7,771
2015	37,385	13,345	14,111	8,057
2016	38,710	13,818	14,611	8,342
2017	40,039	14,293	15,113	8,629
2018	41,353	14,762	15,609	8,912
2019	42,654	15,226	16,100	9,193
2020	43,941	15,686	16,586	9,470
2021	45,214	16,140	17,066	9,744
2022	46,473	16,589	17,541	10,015
2023	47,718	17,034	18,011	10,284
2024	48,950	17,474	18,477	10,550
2025	50,167	17,908	18,936	10,812
2026	51,371	18,338	19,390	11,071
2027	52,561	18,763	19,840	11,328
2028	53,737	19,183	20,284	11,582
2029	54,899	19,597	20,721	11,831
2030	56,047	20,007	21,155	12,079
2031	57,181	20,412	21,583	12,324
2032	58,302	20,812	22,006	12,565
2033	59,408	21,207	22,424	12,804
2034	60,501	21,597	22,836	13,039
2035	61,580	21,982	23,243	13,271

Table 1: Population, Housing and Employment Forecasts

Source: ROSS+associates: Methodology-Population Forecasts (Appendix A). Methodology-Housing and Employment Forecasts (Appendix B).

Employment Forecasts

Table 1 also shows the forecasts for employment growth in Milton, from 2014 to 2035. The employment figures for Milton reflect an analysis of three approaches:

One, a 'percentage share' approach in which the city's number of employees is based on a constant share of all employment in the immediate area (which includes Alpharetta and John's Creek), that in 2010 was 4.56% of all jobs in the area.

Another, the 'averaged' approach calculates a middle ground between the lower 'percentage share' forecast and the higher, recommended approach.

The recommended approach assumes a correlation between employment and the number of households in the city. Although in 2010, 59% of all people working in Milton commuted in from outside the city, the 'internal' ratio can

be a valuable guideline in making estimates. This forecast maintains the expectation that Milton will continue to increase its modest employment base, will benefit from the Transfer of Development Rights program generated by the Conservation Plan, and will actually increase its share of all employment among the three cities in the immediate N. Fulton Superdistrict by several percentage points into the future.

Service Area Projections

In Table 2 the service area forecasts are presented for a single citywide service area measured in two ways: citywide housing units (which quantifies Parks and Recreation service demands), and citywide day/night population (for the public safety services categories, Fire Protection and Law Enforcement).

The 'day/night' population calculation is a combination of the population and future employment projections. The use of day/night population in impact cost and impact fee calculations is based upon the clear rational nexus between persons and services demanded on a 24-hour basis.

The day/night population is used to determine Level of Service standards for facilities that serve both the resident population and business employment. The fire department, for instance, protects one's house from fire whether or not they are at home, and protects stores and offices whether or not they are open for business. Thus, this 'day/night' population is a measure of the total services demanded of a 24-hour service provider facility and a fair way to allocate the costs of such a facility among all of the beneficiaries.

Table 2: Service Area Forecasts

Year	Housing Units (Recreation & Parks)	Day/Night Population (Fire & Police)
2014	13,611	43,831
2015	14,111	45,442
2016	14,611	47,052
2017	15,113	48,668
2018	15,609	50,265
2019	16,100	51,847
2020	16,586	53,411
2021	17,066	54,958
2022	17,541	56,488
2023	18,011	58,002
2024	18,477	59,500
2025	18,936	60,979
2026	19,390	62,442
2027	19,840	63,889
2028	20,284	65,319
2029	20,721	66,730
2030	21,155	68,126
2031	21,583	69,505
2032	22,006	70,867
2033	22,424	72,212
2034	22,836	73,540
2035	23,243	74,851
Increase:	9,632	31,020

The figures on Table 2 are the figures that will be used in subsequent public facility category chapters for Parks & Recreation, Fire Protection and Law Enforcement.

Impact fees for the Road Improvements category are not population based, but based on vehicle trip generation data. As described in the Technical Appendix of this report, future growth and development in the city will account for about 40% of all city-generated traffic on Milton's roads by 2035.

For a more detailed description of the methodologies considered in preparing the population, household, housing unit and employment forecasts, see the Technical Appendix to this report. For statistical reasons, the forecasts in the Appendix cover the 2010 to 2040 time frame, but the figures used for impact fee purposes cover the 20-year period from the present to 2035.

Parks and Recreation

Introduction

Public recreational opportunities are available in Milton through a number of parks facilities operated by the City of Milton Parks and Recreation Department. Demand for recreational facilities is almost exclusively related to the city's resident population. Businesses make some incidental use of public parks for office events, company softball leagues, etc., but the use is minimal compared to that of the families and individuals who live in the city. Thus, the parks and recreation impact fee is limited to future residential growth.

Service Area

The parks and recreation facilities are operated as a citywide system. Facilities are provided equally to all residents, and often used on the basis of the programs available, as opposed to proximity of the facility. For instance, children active in lacrosse play games at various locations, based on scheduling rather than geography. Other programs are located only at certain centralized facilities, to which any Milton resident can come. Thus, the entire city is considered a single service area for parks and recreation.

Level of Service

Level of Service standards for park lands and for recreational components such as baseball fields, playgrounds, and recreation centers have been adopted by the City in the Parks and Recreation Master Plan (2012). Level of Service standards for preserved open space (conservation easements) and land for trails have been adopted by the City in the Conservation Plan (2013).

Table 3 provides an inventory of the acreage under the control of the Parks and Recreation Department in 2014, or expected to come under its control when Providence Park is transferred.

Table 3: Current Inventory of Park Acres and Planned Trails

Existing Park Acre	es	Planned Trail System							
Park / Facility Name	Number of Acres	Trail Type	Existing Miles	Proposed Miles	System Total				
	00.50			C 00	6.00

Total Park Acres	: 284.56	Total Trail Miles:	2.52	90.76	93.28				

* Currently under the control of Fulton County; expected to transfer to Milton in 2015.

** Edge of pavement.

The total 284.56 acres of park land is equivalent to 1 acre for each 31.5 housing units in the city, as shown in Table 4. The Level of Service standards for land and recreation components are expressed in terms of the number of people each acre, component or mile is intended to serve, which can be re-calculated as the number of housing units served by each acre, component or mile. Multi-use trails follow the same calculation procedure as recreation components, but the LOS is based on the future system serving the 2035 population. Since impact fees are assessed at the time a building permit is issued (and the impact fee will be limited to residential uses), the LOS must be converted to a 'per housing unit' basis.

Table 4 shows how the adopted level of service for each recreation component is converted from a 'per population' basis to a 'per housing unit' basis. First, the currently adopted LOS of 1 per 'X' number of people for each component is converted to one component per 'X' housing units using the city's current average household size. This number is then divided into '1' to produce the 'per housing unit' figure.

Table 4: Level of Service Conversion

Component Type	Adopted LOS*			LOS pe	er X Hou	sing Units**	LOS per Each Housing Unit***			
Park Land (acres)	1 acre per	83	population =	1 acre per	31.5	Housing Units =	0.0317919 for each Housing Unit			
Conservation Easements (acres)	1 acre per	22	population =	1 acre per	8.5	Housing Units =	0.1181754 for each Housing Unit			
Land for Trails (acres)	1 acre per	560	population =	1 acre per	211.6	Housing Units =	0.0047270 for each Housing Unit			
Baseball Field	1 per	5,000	population =	1 per	1,887.3	Housing Units =	0.0005299 for each Housing Unit			
Football/Soccer/Lacrosse	1 per	7,000	population =	1 per	2,642.2	Housing Units =	0.0003785 for each Housing Unit			
Basketball Court	1 per	5,500	population =	1 per	2,076.0	Housing Units =	0.0004817 for each Housing Unit			
Playground (Structured)	1 per	1,750	population =	1 per	660.5	Housing Units =	0.0015139 for each Housing Unit			
Picnic Shelter / Pavilion	1 per	1,750	population =	1 per	660.5	Housing Units =	0.0015139 for each Housing Unit			
Community Center	1 per	15,000	population =	1 per	5,661.8	Housing Units =	0.0001766 for each Housing Unit			
Multi-Use Trails	1 mile per	660.16	population =	1 mile per	249.2	Housing Units =	0.0040131 for each Housing Unit			

* Level of Service adopted in Parks and Recreation Master Plan: 1.2 Acres per 100 Population (park land) & 1 Component per population shown. Level of Service adopted in Conservation Plan: 2500 acres in 2030 for conservation easements, and 100 acres in 2030 in land for trails to be purchased. Multi-use Trail LOS based on system build-out in 2035 (93.28 miles serving 61, 580 people).

** Converted using average population per housing unit in 2014. (Exception: conservation easement and land for trails acreage converted using population per housing unit in 2030 due to LOS based on Conservation Plan recommendations for that year.)

*** "1" divided by the number of housing units for each component under "LOS per X Housing Units" column.

2,100 housing units yields 1 basketball court.]

By way of example, the current LOS for basketball courts is 1 court per 5,500 people. That number—5,500—is divided by the 2014 average household size to convert 'people' into 'housing units'. The result is the converted standard of 1 field per 2,100 housing units. By dividing the component (1) by the number of housing units it serves results in the portion of a basketball court that serves 1 housing unit (0.0004761).

[Reversing the calculation, 0.0004761 times Note that the categories of components shown in Table 4 are not necessarily the only component types that are or will be available to City residents in the future.

Forecasts for Service Area

Existing and Future Demand

Table 5 shows the current and future demand in land and recreation components based on the LOS standards adopted by the City and shown on Table 4.

Existing demand is calculated in order to determine if there are currently more than enough facilities to serve the current (2014) population or if there is a shortfall requiring future facilities to be built to serve today's population.

For the number of acres and facilities to meet future population needs, the increase in housing units between now and 2035 is multiplied by each level of service standard to produce the future demand. The 'new units' figure on the Table is the citywide increase taken from Table 2.

Component Type	Adopted LOS per Housing Unit	Existing Demand (2014) *	New Growth Demand (2015-35) **
Park Land	0.0317919	432.72	306.22
Conservation Easements	0.1181754	1,608.485	1,138.265
Land for Trails	0.0047270	64.339	45.531
Baseball Field	0.0005299	7.212	5.104
Football/Soccer/Lacrosse	0.0003785	5.151	3.645
Basketball Court	0.0004817	6.556	4.640
Playground (Structured)	0.0015139	20.606	14.582
Picnic Shelter / Pavilion	0.0015139	20.606	14.582
Community Center	0.0001766	2.404	1.701
Multi-Use Trails (miles)	0.0040131	54.623	38.655

Table 5: Existing and Future Demand

Note that 'demand' figures are expressed in decimals rather than whole numbers. This allows a high level of accuracy when dealing with cost allocations between existing residents and future growth. For instance, a particular new facility may in part meet a current need and in part serve future growth; each would be responsible for their 'fair share' of the cost. As will be seen, however, ultimately recreation component needs are converted to whole numbers.

* 2014 Housing Units = 13,611

** New Units (2035) = 9,632

Impact Fee Eligibility

New parks and recreation components are eligible for impact fee funding only to the extent that the improvements are needed to specifically serve new growth and development, and only at the level of service applicable citywide. Table 6 shows the number of new park acres and recreation components that are needed to satisfy both current and future needs of the city's residents, and the extent to which fulfillment of those needs will serve future growth demand. The table begins with the current inventory of park lands and components, and the 'existing' demand for those components to meet the needs of the current (2014) population based on the adopted level of service standards (from Table 5). The 'excess or (shortfall)' column compares the existing demand to the current supply of park acres and recreation components.

Facility	Current Inventory	Existing Demand	Excess or (Shortfall)	New Growth Demand	Net Total Needed	Whole Total Needed	Percent Impact Fee Eligible
			(
Park Land	284.560	432.720	(148.160)	306.220	454.380	455.000	67%
Conservation Easements	0	1,608.485	(1,608.485)	1,138.265	2,746.750	2,747.000	41.4%
Land for Trails	0	64.339	(64.339)	45.531	109.870	110.000	41.4%
Baseball Field	5	7.212	(2.212)	5.104	7.316	8.000	63.8%
Football/Soccer/Lacrosse	7	5.151	1.849	3.645	1.797	2.000	89.8%
Basketball Court	0.5	6.556	(6.056)	4.640	10.696	11.000	42.2%
Playground (Structured)	2	20.606	(18.606)	14.582	33.188	34.000	42.9%

Table 6: Future Park Facility Impact Fee Eligibility

Where an 'excess' is identified, that means that more land or components (or portions of components) exist than are needed to meet the recreation needs of the current population, and those 'excesses' create capacity to meet the recreational needs of future growth. Conversely, a 'shortfall' indicates that there are not enough facilities and more components (or portions of components) are needed to meet the recreational needs of the current population based on the adopted LOS.

The next column on Table 6 shows the total demand in land and components specifically to meet future growth needs, and the 'net total needed' to meet all existing and future needs combined. A current 'excess' in facilities reduces the need for new facilities because the 'excess' is already available to serve new growth. A 'shortfall', however, adds to new growth's needs with facilities to bring the current population up to the adopted level of service required to be available to all—both current and future residents.

For example, the City has 7 football/soccer/lacrosse fields but the adopted level of service indicates that only 5 fields and a portion of a 6th (0.151 or 15.1%) are needed to serve the current population, leaving the remainder of the 6th field and all of the 7th field available to serve future growth. Future growth, however, will need a total of 3.645 fields to fully satisfy its needs, based on the adopted LOS. Since 1.849 existing fields are currently available, only 1.797 new field capacity will be needed to meet future demand. This figure is rounded up to 2 new fields (since the Parks and Recreation Department cannot construct only a portion of a new facility), of which the 1.797 portion needed for new growth represents 89.8% of the total to be built.

On the other hand, the City has only 5 baseball fields where 7.212 in field capacity is needed to serve current needs, leaving a 'shortfall' in capacity of 2.212 fields. New growth will need 5.104 fields for itself, to which is added the current population's shortfall for a total of 7.316 to provide for both current and future needs. Rounded to 8 new fields, new growth needs only 63.8% of the total to satisfy its own demand.

Future Costs

Table 7 on the next page presents the estimated cost calculations for both the land acquisition and recreation component projects proposed and the maximum extent to which the project costs are impact fee eligible.

The figures in the 'components proposed' column are drawn from the 'whole total needed' column in Table 6. The 'total cost figures' on the Table are converted to 'new growth share' dollars based on the percentage that each improvement is impact fee eligible. Note that this affects most of the recreation components to the extent that partial components identified in the 'net total needed' column of Table 6 had to be rounded up to whole components, creating an 'overage' portion of each facility type.

* Sources: Milton Parks and Recreation Master Plan (2012) and Conservation Plan (2014) for land and facilities; Milton Transportation Engineer for per mile trail construction costs.

** Includes contingency at 15% and architectural/engineering services at 7%.

*** Construction dates vary. NPV based on CPI, BCI or CCI as appropriate, in an average construction year of 2025.

To calculate the Net Present Value of the impact fee-eligible cost estimate for non-construction improvements (the new park land), the currently estimated 2014 cost is inflated to the target year using the 10-year average CPI and then is reduced using the Net Discount Rate. For the construction of the recreation components, the NPVs are calculated by increasing the current (2014) esti-

mated construction costs using the Engineering News Record's 10-year average building cost inflation (BCI) rate for buildings (community centers) and the average construction cost inflation (CCI) rate for all other projects. All project costs are then reduced to current dollars using the Net Discount Rate.

Fire Protection

Introduction

Fire protection is provided by the City through its Fire Department. The capital value of fire protection is based upon fire stations, land, and apparatus. Emergency medical services are administered by the Fire Department, but are provided under contract to a private vendor that provides and maintains the ambulances. The Department provides space to house one of the ambulances in Fire Station 43.

Service Area

The Fire Department operates as a coordinated system, with each station backing up the other stations in the system. The backing up of another station is not a rare event; it is the essence of good fire protection planning. All stations do not serve the same types of land uses, nor do they all have the same apparatus. It is the strategic placement of personnel and equipment that is the backbone of good fire protection. Any new station would relieve some of the demand on the other stations. Since the stations would continue to operate as 'backups' to the other stations, everyone in the city would benefit by the construction of a new station since it would reduce the 'backup' times the station nearest to them would be less available. For these reasons the entire city is considered a single service area for the provision of fire protection because all residents and employees within this area have equal access to the benefits of the program.

Table 8: Inventory of Fire Protection Facilitie	s

Total General Vehicles		8
Other		
Emergency Warning Sirens		10

* Vehicles having a service life of 10 years or more.

** Technical Large Animal Emergency Rescue

Currently, fire protection is provided by facilities with a combined square footage of 21,747, utilizing a total of 16 vehicles (that is, vehicles having a service life of 10 years or more). Eight of the vehicles are heavy vehicles providing fire and rescue services and 8 are general support vehicles.

In addition, this year the City has installed 10 emergency warning sirens throughout the city. Since the coverage of each siren is related to geographical area (i.e., how far away can the siren be heard), it is estimated that all 10 will serve the entire city to 2035 at an expected life of 20 years.

Table 8 presents the current inventory of Fire Department facilities, vehicles and sirens.

Level of Service

The level of service for fire protection in Milton is measured in terms of the number of heavy and general vehicles, the number of square feet of fire station space and the number of emergency warning sirens, per day/night population in the service area. Day/night population is used as a measure in that fire protection is a 24-hour service provided continuously to both residences and businesses in the service area.

Table 9 presents the calculation of the current level of service.

Table 9: Current Level of Service Calculation

Facility	Service Population*	Level of Service		
Existing Square Feet	2014 Day/Night Population	Square Feet per Day/Night Population		
21,747	43,831	0.4962		
Existing Heavy Vehicles	2014 Day/Night Population	Heavy Vehicle per Day/Night Population		
8	43,831	0.000183		
Existing General Vehicles	2014 Day/Night Population	General Vehicle per Day/Night Population		
8	43,831	0.000183		
Existing Emergency Warning Sirens	2035 Day/Night Population	Emergency Warning Sirens per Day/Night Population		
10	74,851	0.000134		

* The current level of service for the emergency warning sirens is based on the total 2035 day/night population, as the existing sirens will serve the City for the next 20 years. The level of service calculated for the Department's occupied floor area and vehicles are based on the current day/night population. This level of service will be projected forward to 2035 to determine future improvements needed to serve new growth while maintaining the current level of service enjoyed citywide.

The level of service for the sirens, however, is different. Since the current complement of sirens is expected to serve the city for the next 20 years, the level of service is calculated based on the 2035 day/night population. In essence working backwards, new growth's share of the total expense can be determined (as shown in the following Section).

Forecasts for Service Area

Future Demand

The Level of Service standards from Table 9 are multiplied by the forecasted day/night population increase to produce the expected future demand in Table 10. As discussed in the previous Section, the current level of service is used to calculate future demand for space expansion and new vehicles, while new growth's share of the 10 emergency warning sirens is based on the level of service that will exist in 2035, covering both existing and future populations. The result, for the sirens, is that 41.44% of the sirens specifically serve future growth and development

The 'day/night population increase' figures are taken from Table 2: Service Area Forecasts.

Level of Service	Future Population	New Growth Demand
Square Feet per Day/Night Population	Day/Night Population Increase (2014-35)	Net New Square Feet Demanded
0.4962	31,020	15,391
Heavy Vehicle per Day/Night Population	Day/Night Population Increase (2014-35)	Net New Heavy Vehicles Demanded*
0.000183	31,020	5.662
General Vehicle per Day/Night Population	Day/Night Population Increase (2014-35)	Net New General Vehicles Demanded**
0.000183	31,020	5.662
Emergency Warning Sirens per Day/Night Population	Day/Night Population Increase (2014-35)	Number of Sirens for New Growth***
0.000134	31,020	4.144

Table 10: Future Demand Calculation

* 6 heavy vehicles will have to be added to the inventory, one of which will only be 94.4% eligible for impact fee funding. (7 are proposed)
** 6 general vehicles will have to be added to the inventory, one of which will only be 94.4% eligible for impact fee funding. (7 are proposed)
*** New growth's 'share' of the 10 sirens is 4.144 (or 41.44% of the total 10).

Because only 'whole' vehicles can be purchased, 'more' new vehicles need to be added than are technically demanded by new growth. Thus, while 6 heavy vehicles and 6 general vehicles need to be acquired to cover expansion of the fleet to meet the needs of future growth and development, one of each type of vehicle will not be 100% eligible. In addition, one more vehicle in each category is proposed to be acquired over the 20-year period, which would not be impact fee eligible at this time. The additional vehicles and the portions of the 6th vehicles will, however, provide service to growth beyond 2035, if any, and can be funded through a future extension of the City's impact fee program at that time if warranted.

Table 11 and Table 12 provide an annual breakdown of the future demand for stations and equipment following the adopted level of service standards. The facility projects shown in Table 11 are based on the City's desire to increase the inventory of fire protection facilities in a balanced way; the final projects could be reconfigured, with 15,391 square feet ultimately being impact fee eligible. Of the 10 emergency warning sirens recently installed, only the portion that is eligible for impact fee consideration is shown to serve new growth.

Year	Day/Night Population Increase	Square Feet Demanded (annual)	Running Total: Square Feet Needed	Project	Total Sq Feet Proposed	Eligible Square Footage	Eligible Number

Table 11: Future Fire Protection Facility Projects

* Only the impact fee eligible sirens are shown, of the total 10 sirens installed.

** 6000 sf fire station replaces an existing 3600 square foot station. Only the increase in floor area (2400 sf) is therefore impact fee eligible.

The total demand figures in Table 12 reflect the 'overage' between the vehicles to be acquired and the 'technical' demand created by new growth.

Future Costs

The future facility floor area and the number of vehicles needed to meet the demand created by new growth and development in the future are transferred from Table 11 and Table 12 to Table 13, including the years in which the various improvements are anticipated to be needed.

Estimated improvement costs (in 2014 dollars) are based on the following:

For new facility space, prevailing construction costs averaging \$210 per square foot are used, reflecting cost estimates provided by the Fire Department. Note that a portion of the fire station project shown in the year 2017 is not impact fee eligible. The project—shown in Table 13 with its full square footage figure (compare to Table 11)—is a mixture of replacement space and new space. Only the net new space serves new growth and is thus impact fee eligible.

For heavy vehicles, costs were averaged among the various vehicle categories to determine the average per vehicle cost for the fleet. The same methodology was used to determine general vehicle costs. These figures, rounded to \$443,500 and \$38,200 for heavy vehicles and general vehicles, respectively, were used in order to preserve flexibility in the determination of which specific vehicles to acquire in the future.

For the emergency warning sirens, the actual 2014 cost of purchase and installation is shown.

The total cost figures are then converted to 'impact fee cost (2014)' dollars based on the percentage that each improvement is impact fee eligible. Note that this affects the 'overage' portion of the vehicles that resulted from rounding up to whole numbers and the two additional vehicles that are not impact fee eligible, as well as new growth's share of the sirens and the fire station expansion.

Avg Cost per Unit	\$210	\$21,633	\$443,500	\$38,200		\$7,996,	339.	00			\$6	5,184,800.60	\$7	7,136,658.50		

Table 13: Project Costs to Meet Future Demand

* Total square footage is shown for the fire station replacement project in year 2017; the amount of facility space that replaces the previous facility (3600 sf) is not impact fee eligible (only net new square footage is eligible).

** All 10 existing emergency warning sirens are shown, of which 4.144 (41.44%) are impact fee eligible.

The Net Present Value of the cost estimates for new building construction are calculated by increasing the current (2014) estimated construction costs using the Engineering News Record's 10-year average building cost inflation (BCI) rate, and then discounting this future amount back to 2014 dollars using the Net discount Rate. For non-construction improvements (all vehicles) the currently estimated costs are inflated to their target years using the 10-year average CPI and then reduced using the Net Discount Rate to produce the Net Present Value.

Law Enforcement

Introduction

The Milton Police Department provides primary law enforcement throughout the city. Through a variety of active law enforcement, community outreach and educational programs, the Police Department serves all of the population and employees within the city.

Service Area

The city is considered a single service area for the provision of primary law enforcement services because all residents and employees in the city have equal access to the benefits of the program.

Level of Service

The Police Department currently occupies leased facility space, which includes square footage for administration, operations, evidence storage, and general storage. The Police Department has outgrown this space and is slated to relocate to a larger facility. Construction of the City of Milton Law Enforcement Center is proposed in the near future, and will accommodate all City law enforcement staff and functions.

Statistics for the proposed facility are shown in Table 14.

Table 14: Planned Law Enforcement Space

Table 15: Current Level of Service Calculation

Facility	Service Population	Level of Service			
Proposed Square Feet	2035 Day/Night Population	Square Feet per Day/Night Population			
20,000	74,851	0.2672			

Table 15 presents a calculation of the level of service, based on the planned, new facility space and the future (2035) day/night population. Day/night population is used as a measure in that law enforcement services are provided to both residences and businesses in the service area. The new Law Enforcement Center is expected to serve the current and future population to 2035.

Forecasts for Service Area

Future Demand

Since the Law Enforcement Center is needed now to relieve overcrowded conditions and will serve future needs for years to come, the portion of the expansion that will specifically meet the needs of new growth and development must be determined.

Table 16: Future Demand Calculation

Level of Service	Future Population	New Growth Demand	New Growth Share of Total
Square Feet per Day/Night Population	Day/Night Population Increase (2014-35)	Net New Square Feet for New Growth	Percent Impact Fee Eligible
0.2672	31,020	8,288	41.44%

In Table 16, the facility space LOS standard from Table 15 is multiplied by the forecasted day/night population increase to produce the expected future demand in square feet. This is 41.44% of the total to be constructed.

Table 17: Law Enforcement Center Project Costs

Future Costs

Future cost to meet the improvements demanded by new growth to 2035 is shown in Table 17, which also indicates the year in which system improvement project phases are proposed.

Estimated improvement costs (in 2014 dollars) are based on construction costs averaging \$210 per square foot. The price per square foot reflects cost estimates provided by the City.

The total cost figures are then converted to 'impact fee cost (2014)' dollars based on the percentage that each improvement is impact fee eligible.

Note that a portion of project costs are not impact fee eligible. Of the 20,000 square foot facility, 8,288 square feet is impact fee eligible as calculated on Table 16 (which is 41.44

* Source: City of Milton FY 2015 Budget, Capital Improvement Program 2015-2021.

percent of the total). This percentage is applied to the cost of the new facility on Table 17 to determine the amount that could be collected in an impact fee program. In turn, the amounts that are impact fee eligible (in 2014 dollars) are converted to Net Present Value.

The Net Present Value of the cost estimate for the building expansion is calculated by increasing the current (2014) estimated construction costs using the Engineering News Record's 10-year average building cost inflation (BCI) rate, and then discounting this future amount back to 2014 dollars using the Net Discount Rate. For the communications equipment upgrade, the Consumer Price Index (CPI) is used. (The approaches to calculating NPV are explained in detail in the Cost Adjustments and Credits Section of this report.)

Road Improvements

Introduction

The information in this chapter is derived from road project information contained in the *Milton Capital Improvement Plan 2015—2021* (the "CIP") and project data for future years based on the City's *Comprehensive Transportation Plan*.

Service Area

The service area for these road projects is defined as the entire city, in that these road projects are recognized as providing primary access to all properties within the city as part of the citywide network of principal streets and thoroughfares. All new development within the city will be served by this citywide network, such that improvements to any part of this network to relieve congestion or to otherwise improve capacity will positively affect capacity and reduce congestion throughout the city.

• Level of Service Standards

Level of Service for roadways and intersections is measured on a 'letter grade' system that rates a road within a range of service from A to F. Level of Service A is the best rating, representing unencumbered travel; Level of Service F is the worst rating, representing heavy congestion and long delays. This system is a means of relating the connection between speed and travel time, freedom to maneuver, traffic interruption, comfort, convenience and safety to the capacity that exists in a roadway. This refers to both a quantitative measure expressed as a service flow rate and an assigned qualitative measure describing parameters. *The Highway Capacity Manual, Special Report 209*, Transportation Research Board (1985), defines Level of Service A through F as having the following characteristics during peak hours at an intersection:

- 1. LOS A: free flow, excellent level of freedom and comfort;
- 2. LOS B: stable flow, decline in freedom to maneuver, desired speed is relatively unaffected;
- 3. LOS C: stable flow, but marks the beginning of users becoming affected by others, selection of speed and maneuvering becomes difficult, comfort declines at this level;
- 4. LOS D: high density, but stable flow, speed and freedom to maneuver are severely restricted, poor level of comfort, small increases in traffic flow will cause operational problems;
- 5. LOS E: at or near capacity level, speeds reduced to low but uniform level, maneuvering is extremely difficult, comfort level poor, frustration high, level unstable; and
- 6. LOS F: forced/breakdown of flow. The amount of traffic approaching a point exceeds the amount that can transverse the point. Queues form, stop & go. Arrival flow exceeds discharge flow.

The traffic volume that produces different Level of Service grades differs according to road type, size, signalization, topography, condition and access.

Level of Service

The City has set its Level of Service for road improvements at LOS "D" for peak hour intersection operations, a level to which it will strive ultimately. However, interim road improvement projects that do not result in a LOS of "D" will still provide traffic relief to current and future traffic alike, and are thus eligible for impact fee funding.

All road improvement projects benefit existing and future traffic proportionally to the extent that relief from over-capacity conditions eases traffic problems for everyone. For example, since new

growth by 2035 will represent a certain portion of all 2035 traffic, new growth would be responsible for that portions' cost of the road improvements.

It is noted that the cost-impact of non-Milton generated traffic on the roads traversing the city (cross commutes) is off-set by state and federal assistance. The net cost of the road projects that accrues to Milton reasonably represents (i.e., is 'roughly proportional' to) the impact on the roads by Milton residents and businesses.

The basis for the road impact fee would therefore be Milton's cost for the improvements divided by all traffic in 2035 (existing today plus new growth)—i.e., the cost per trip—times the traffic generated by new growth alone. For an individual land use, the cost per trip (above) would be applied to the number of trips that will be generated by the new development when a building permit is issued, assuring that new growth would only pay its 'fair share' of the road improvements that serve it.

■ Forecasts for Service Area

Projects that provide road capacity that will serve new growth are shown on Table 18. This is not a list of all City road projects in the CIP. These projects were selected for inclusion in the City's impact fee program because the specific improvements proposed will increase traffic capacity and reduce congestion to some extent, whether through road widening, improved intersection operations or upgraded signalization.

The cost figures shown on Table 18 are in current dollars. These figures are calculated in Net Present Value and shown on Table 19. The Net Present Value of the cost estimates for road improvements are calculated by increasing the current (2014) estimated construction costs using the Engineering News Record's 10-year average construction cost inflation (CCI) rate, and then discounting this future amount back to 2014 dollars using the Net discount Rate. (The approaches to calculating NPV are explained in detail in the Cost Adjustments and Credits chapter of this report.)

* Net Present Value = 2014 cost estimate inflated to target year using the ENR Construction Cost Index, reduced to 2014 NPV using the Discount Rate.

Eligible Costs

As discussed thoroughly in the Methodology—Trip Generation section of the Technical Appendix, new growth and development will represent 40.1% of the traffic on Milton's road network in 2035. To that extent, new growth's fair share of the road project costs that are attributed to new growth are shown on the following table.

Table 20: Eligible Cost Calculation

Project	Total Cost NPV	% Impact Fee Eligible*	New Growth Cost
Intersection-Hopewell/Francis/Cogburn	\$ 992,103	40.1%	\$ 397,918.39
Intersection-Deerfield Pkwy @ Morris Rd	85,206	40.1%	\$ 34,174.91
Intersection-Bethany @ Cogburn	446,923	40.1%	\$ 179,254.45

Exemption Policy

The Georgia Development Impact Fee Act provides that the City's "impact fee ordinance may exempt all or part of particular development projects from development impact fees if:

(1) Such projects are determined to create extraordinary economic development and employment growth or affordable housing;

(2) The public policy which supports the exemption is contained in the [city's] comprehensive plan; and

(3) The exempt development project's proportionate share of the system improvement is funded through a revenue source other than development impact fees."

The following Exemption Policy is included in this CIE and thus becomes part of the City's Comprehensive Plan:

The City of Milton recognizes that certain office and retail trade development projects provide extraordinary benefit in support of the economic advancement of the city's citizens over and above the access to jobs, goods and services that such uses offer in general. To encourage such development projects, the Mayor and City Council may consider granting a reduction in the impact fee for such a development project upon the determination and relative to the extent that the business or project represents extraordinary economic development and employment growth of public benefit to Milton, in accordance with exemption criteria the City may adopt. It is also recognized that the cost of system improvements otherwise foregone through exemption of any impact fee must be funded through revenue sources other than impact fees.

While this policy provides that exemption criteria may be approved by the City Council as part of its Impact Fee Ordinance, the adoption of such criteria is elective on the part of the City Council and may or may not be activated through inclusion in the Ordinance.

Glossary

The following terms are used in the Impact Fee Methodology Report. Where possible, the definitions are taken directly from the Development Impact Fee Act.

Capital improvement: an improvement with a useful life of ten years or more, by new construction or other action, which increases the service capacity of a public facility.

Capital improvements element: a component of a comprehensive plan adopted pursuant to Chapter 70 of the Development Impact Fee Act which sets out projected needs for system improvements during a planning horizon established in the comprehensive plan, a schedule of capital improvements that will meet the anticipated need for system improvements, and a description of anticipated funding sources for each required improvement.

Development: any construction or expansion of a building, structure, or use, any change in use of a building or structure, or any change in the use of land, any of which creates additional demand and need for public facilities.

Development impact fee: a payment of money imposed upon development as a condition of development approval to pay for a proportionate share of the cost of system improvements needed to serve new growth and development.

Eligible facilities: capital improvements in one of the following categories:

- (A) Water supply production, treatment, and distribution facilities;
- (B) Waste-water collection, treatment, and disposal facilities;

(C) Roads, streets, and bridges, including rights of way, traffic signals, landscaping, and any local components of state or federal highways;

(D) Storm-water collection, retention, detention, treatment, and disposal facilities, flood control facilities, and bank and shore protection and enhancement improvements;

- (E) Parks, open space, and recreation areas and related facilities;
- (F) Public safety facilities, including police, fire, emergency medical, and rescue facilities; and
- (G) Libraries and related facilities.

Impact Cost: the proportionate share of capital improvements costs to provide service to new growth, less any applicable credits.

Impact Fee: the impact cost plus surcharges for program administration and recoupment of the cost to prepare the Capital Improvements Element.

Level of service: a measure of the relationship between service capacity and service demand for public facilities in terms of demand to capacity ratios or the comfort and convenience of use or service of public facilities or both.

Project improvements: site improvements and facilities that are planned and designed to provide service for a particular development project and that are necessary for the use and convenience of the occupants or users of the project and are not system improvements. The character of the improvement shall control a determination of whether an improvement is a project improvement or system improvement and the physical location of the improvement on site or off site shall not be considered determinative of whether an improvement is a project improvement or a system improvement. If an improvement or facility provides or will provide more than incidental service or

facilities capacity to persons other than users or occupants of a particular project, the improvement or facility is a system improvement and shall not be considered a project improvement. No improvement or facility included in a plan for public facilities approved by the governing body of the municipality or county shall be considered a project improvement.

Proportionate share: means that portion of the cost of system improvements which is reasonably related to the service demands and needs of the project.

Rational Nexus: the clear and fair relationship between fees charged and services provided.

Service area: a geographic area defined by a municipality, county, or intergovernmental agreement in which a defined set of public facilities provide service to development within the area. Service areas shall be designated on the basis of sound planning or engineering principles or both.

System improvement costs: costs incurred to provide additional public facilities capacity needed to serve new growth and development for planning, design and engineering related thereto, including the cost of constructing or reconstructing system improvements or facility expansions, including but not limited to the construction contract price, surveying and engineering fees, related land acquisition costs (including land purchases, court awards and costs, attorneys' fees, and expert witness fees), and expenses incurred for qualified staff or any qualified engineer, planner, architect, landscape architect, or financial consultant for preparing or updating the capital improvement element, and administrative costs, provided that such administrative costs shall not exceed 3 percent of the total amount of the costs. Projected interest charges and other finance costs may be included if the impact fees are to be used for the payment of principal and interest on bonds, notes, or other financial obligations issued by or on behalf of the municipality or county to finance the capital improvements element but such costs do not include routine and periodic maintenance expenditures, personnel training, and other operating costs.

System improvements: capital improvements that are public facilities and are designed to provide service to the community at large, in contrast to 'project improvements.'

Methodology—Population Forecasts

The purpose of this analysis is to develop population forecasts for use in establishing Level of Service calculations for the City's impact fee program. The population forecasts will subsequently influence the housing unit and employment forecasts that will also be used in the Level of Service calculations.

To accomplish this, a variety of projection approaches were prepared for consideration. Data from both the US Bureau of the Census and the Atlanta Regional Commission were considered, as well as countywide forecasts prepared by Woods & Poole Economics, Inc.

The various approaches presented in the attached Analysis are:

- 2000–2013 Census population data projected to 2040 on a "straight line" basis for each city in North Fulton County—called the Linear Trend approach.
- 2000–2013 Census population data projected to 2040 for each North Fulton city assuming that the ARC Plan 2040 North Fulton projections are incorrect by the same increment as "straight line" determined for 2016 (ARC's first "base" year)—called the Linear Shift approach.
- 2000–2013 Census population data projected to 2040 on a "curved line" basis for each city in North Fulton County as 2nd-order regression—called the Growth Trend.
- 2000–2013 Census population data projected to 2040 assuming that the ARC Plan 2040 North Fulton projections are incorrect by the same increment as determined for 2016 using the growth trend figure—called the Growth Shift.
- The percentage share of countywide population projected for each North Fulton city taken against the ARC Plan 2040 forecasts and those of Woods & Poole Economics, Inc.
- Finally, the capacity of the city to accommodate future development was considered, based on policies in place regarding residential densities and land conservation initiatives.

Note that, in order to maintain data consistency with available data sources, the period 2000-2040 is used in preparing the forecasts. However, for the impact fee program, the 20-year period 2014-2035 will be used.

Historic Trends

Since 2000, the city's population growth has far exceeded its North Fulton neighbors. During these past 13 years, (if the Census Bureau's 2000 estimate is accurate) Milton's population has more than doubled (increasing 124%) at an average annual rate of a little over 9.5%. During this same period, Alpharetta and John's Creek kept pace with North Fulton as a whole with per-

Comparative Growth Rates - North Fulton Cities

				Increase		Share of N	orth Fulton
	2000	2013	Number	Percent	Avg/Year	Percent	Avg/Year
Alpharetta	47,229	62,298	15,069	31.91%	2.45%	-1.09%	-0.08%
Johns Creek	61,522	82,788	21,266	34.57%	2.66%	0.91%	0.07%
Milton	16,035	35,907	19,872	123.93%	9.53%	67.92%	5.22%
Mountain Park (pt.)	518	576	58	11.20%	0.86%	-16.62%	-1.28%
Roswell	81,361	94,034	12,673	15.58%	1.20%	-13.33%	-1.03%
Total - North Fulton	206,665	275,603	68,938	33.36%	2.57%	100.00%	n/a

Year 2000 population for Milton and Johns Creek estimated by US Bureau of the Census.

centage increases in the low-mid 30s, while Roswell and Mt. Park notably lagged with 16% and 11% increases, respectively (yielding average annual growth rates around 1%).

During this same period, Milton's share of the North Fulton population grew almost 68%, from 7.76% in 2000 to 13.03% in 2013 (increasing its share at an average annual rate of a little over 5.2%). Two of its neighbors—Mt. Park and Roswell—saw their share of North Fulton notably reduced, while Alpharetta and John's Creek barely held their own.

Given the limitations on developable land resources in its neighboring North Fulton cities, continuing market pressures for residential growth, quality public services both existing and planned, and the ambience clearly established in Milton's many fine neighborhoods, growth—at least managed growth—is expected to continue throughout the projection period.

Recommendation

While there is considerable divergence among the various approaches considered in the attached Analysis, we have focused on the Build-out Capacity, the Linear Trend, and the County Share approach using the Woods & Poole countywide figures, for further consideration. The table and graph below show these three scenarios, while the Analysis that follows provides a detailed description of the many and various approaches that were prepared and the methodologies and data used

Bottom line: the **Build-out Capacity approach** is recommended as the basis for the City's Impact Fee Program because it fully recognizes the limited amount of available land for development when the City's land conservation policies are taken into consideration, as well as City policies regarding future development densities and the potential for TDRs.

						2014	- 2035 Ch	ange
Approach	2014	2020	2025	2030	2035	Increase	Percent	Avg/Year
Buildout Capacity	36,060	43,941	50,167	56,047	61,580	25,520	70.8%	3.54%
Linear Trend	38,508	48,303	56,466	64,629	72,792	34,285	89.0%	4.45%
Percent of County (W&P)	39,180	50,345	60,406	71,034	82,135	42,955	109.6%	5.48%

Linear

% of County

Recommended Alternate Population Forecasts

City of Milton - 2014-2035

Buildout

The reasons for our recommendation are:

The Linear Trend and the County Share approaches reflect residential growth potential that could only be achieved if City policies change in the future, and therefore should be viewed more as 'market demand' potential than most likely growth outcomes. Between the two, the Linear Trend forecast is more favored because it directly relies on historic city population data and trends (as estimated by the Census Bureau) and is somewhat more defensible than tying the city's future growth to that of the whole county.

The Linear Trend and the County Share approaches are both unconstrained by land availability and would rely on rezoning approvals not contemplated in the City's Comprehensive Plan. In contrast, the Build-out Capacity approach recognizes the limited amount of available land for development when the City's land conservation policies are taken into consideration, along with the potential for transfers of development rights recommended in the Conservation Plan, as well as the City's policies regarding future development densities within areas that are currently provided with sanitary sewer service and within areas that are not, and will not, be sewered.

In our view, the Build-out Capacity forecasts are the most consistent with current planning policies incorporated into the City's Comprehensive Plan, including development policies regarding future residential densities, which are summarized in the Plan's vision statement:

Milton is a distinctive community embracing small town life and heritage while preserving and enhancing our rural character.

Further support for the Build-out Capacity approach is that it reflects the City's emerging policies for land conservation embodied in the Conservation Plan, which limits the amount of land available for development, and further being considered in the creation of a conservation subdivision alternative for residential development.

Population Forecasts An Analysis of

City of Milton

Historic Population Growth

casts have to be made for each of the five cities that comprise North Fulton in order to compare The lowest common geographic denominator with ARC's Plan 2040 forecasts is all of Fulton County north of the Chattahoochee River (which consists growth in the area, overall, to ARC forecasts. Secondly, since ARC figures are not given for 2035, the forecasts have to extend to 2040 for of two ARC "superdistricts" - neither of which actually coincides with city limit lines). Thus, forecomparability.

Regional Forecasts

Next, a summary of the forecasts prepared by the Atlanta Regional Commission as part of their Plan 2040 is shown on Table 2, for North Fulton and the county as a whole.

Two ARC Superdistricts comprise North Fulton County – the Roswell Superdistrict and the N Fulton Superdistrict. They are totaled to compare to the five cities collectively that make up North Fulton. Table 2 shows the figures for ARC's benchmark years starting in countywide data from Woods & Poole Economics are shown for lower than ARC's for the county as a whole, as are their forecasts of the number of households, as would be expected. We note that ARC 2016 and ending in 2040. (There are no figures for 2035.) Population, household and employment figures are shown. In addition, comparison. Woods & Poole population forecasts are consistently used a population for the county in 2010 of 965,593 while the Census Bureau's 2010 Census count was considerably lower at 920,581.

sources often are counting the number of persons that work, so a More notably, Woods & Poole countywide employment forecasts are much higher than the ARC figures. Working with the US Bureau of Economic Analysis, Woods & Poole counts jobs and includes sole proprietors and part-time jobs. Employment data from other person working at two or more jobs would be counted as only 'one". This difference will be important when the employment forecasts are prepared for the impact fee program.

Projecting Historic Trends into the Future

In order to get a "handle" on population projections for North Fulton, the population figures from the Census Bureau (Table 1) are projected to the year 2040 using two types of regression analysis (often called "trend analysis"):

- tionship between the data for each year, and projects that The "linear trend" regression assumes a straight line relaline forward. •
- curve to the data, whether an acceleration or deceleration over time, that will continue into the The "growth trend" regression assumes there may be some future.

two projections for 2014-2040 for North Fulton are shown on Table 3. (ARC benchmark years are Both of these are mathematical exercises, but valuable for comparison purposes. The results of the shown in bold.)

Technical Appendix

Adjusting the Regional Forecasts

ARC's Plan 2040 population forecasts for North Fulton are clearly inaccurate. The ARC population figure for 2016 (247,310) is far less than the projected population figures from Table 3, which range from 291,176 (linear trend) to 296,150 (growth trend), and is even less than the Census figure for 2012. According to the Census Bureau, ARCs 2016 figure for North Fulton was exceeded in 2009.

Two approaches are used to address this problem with regard to population, and are shown on Table 4.

- The first is to use the projections for the benchmark years taken from Table 3. When used on later tables, these projections are referred to as the "trend approach".
- The second is to assume that ARC's figures are incrementally off, and to adjust each benchmark year by the 2016 multiplier; in essence, this shifts ARC's line on a graph without changing its rate of increase (i.e., the "slope" of the graph line remains the same).

The North Fulton Population section of Table 4 shows the two adjustment approaches indicated above. The Linear Trend and Growth Trend results from the regression analysis of the 2000-2013 Census Bureau estimates from Table 3 are inserted under their appropriate years. Below that on Table 4, the ratio between the linear trend figure and the ARC figure for 2016 is calculated, and applied to the ARC figures in subsequent years as a multiplier. This is referred to as the "linear shift" approach. Similarly, the growth trend-to-ARC ratio is calculated and multiplied times subsequent years to produce the "growth shift" approach. For adjustments to the number of households, we fall back on average household size calculations. The average household size determined by dividing the ARC population by the ARC number of households for North Fulton is divided into the linear trend and growth trend populations to produce the respective household projections for each year. Adjustments to employment utilized the ratio between the ARC employment figures and the number of households in the ARC projections. These employment-to-households ratios are then applied to the linear trend and growth trend number of households calculated above to produce new employment figures for each benchmark year for each approach. (Though employment is not directly connected to the number of households because of cross-jurisdictional commuting, the point was to adjust the ARC figures using their own data which had already taken commuting patterns into consideration.)

Alternate Projections

The tables on the next three pages present three alternate projections for the cities that comprise North Fulton. The first two alternates are the linear model approach (including the "trend" method and the "shift" method discussed above), and the growth model approach ("trend" and "shift"). In each case, the city percentages of North Fulton population are projected to 2040 using the linear regression and the growth regression methods, respectively. These percentages are multiplied times the North Fulton total population figures projected using the linear and the "shift" method discussed above.

Table 4: Adjustments to Regional Forecasts 2016-2040

		North	Fulton Popul	ation

The third set of tables (on page 6) present the Fulton County Share approach. To accomplish this, the
city percentages of the Fulton County population totals estimated by the Census Bureau for the 2000-
2013 years (from Table 1) are projected to 2040 using a linear regression. These percentages are then
multiplied against the ARC Plan 2040 county totals and the Woods & Poole county totals for compari-
son. This approach, of course, assumes an evolving relationship between the population of the cities in
North Fulton and the county as a whole.

## **Discussion of Alternate Forecasts**

While there is considerable divergence among the various approaches considered in this Analysis, we have focused on the Build-out Capacity, the Linear Trend, and the County Share approach using the Woods & Poole countywide figures, for further discussion.

9.53%). At the "high" end, the County Share approach results in a bit more than a Compared to the 124% population increase experienced over the past 13 years, the Linear Trend approach results in a 2035 population increase of 89%, which averages out to a 4.45% increase per year (the 2000-2013 average annual increase was doubling of today's population, but still at an average annual growth rate of 5.45%, which is still much lower than experienced over the past 13 years.¹ The Build-out Capacity approach results in a more modest (but more realistic) 2035 population increase of almost 71%, which averages out to a 3.54% increase per year

tial that could only be achieved if City policies change in the future, and therefore The Linear Trend and the County Share approaches reflect residential growth potenshould be viewed more as 'market demand' potential than most likely growth outcomes. Between the two, the Linear Trend forecast is more favored because it directly relies on historic city population data and trends (as estimated by the Census Bureau) and is somewhat more defensible than tying the city's future growth to that of the whole county. The Linear Trend and the County Share approaches are both unconstrained by land prehensive Plan. In contrast, the Build-out Capacity approach recognizes the limited rights recommended in the Conservation Plan, as well as the City's policies regarding availability and would rely on rezoning approvals not contemplated in the City's Comamount of available land for development when the City's land conservation policies are taken into consideration, along with the potential for transfers of development future development densities within areas that are currently provided with sanitary sewer service and within areas that are not, and will not, be sewered. The table and graph to the right show the three scenarios given further consideration (and is also discussed at the beginning of this Appendix).

¹ Calculations of growth since 2000 begin with an estimate by the Census Bureau of the population that occupied the area that subsequently became incorporated as the City of Milton. That figure, shown on Table 1 as 16,035, has been question by Plan-ning officials as being inaccurate and probably too low.

### Methodology—Housing and Employment Forecasts

Based on the "Build-out Capacity" population forecasts presented in the Population Methodology, this paper estimates the future number of households, housing units and employment in the city. Note that parks & recreation LOS standards will be based on the number of housing units, while fire and police will combine population and employment into a "day-night" population to reflect their 24-hour service demand.

### **Housing Units**

The table on the next page shows how the housing projections were figured. The approach is to calculate the number of households (which equates to the number of occupied housing units) and then to expand that to the total number of housing units by adding in vacant units.

Our assumption is that the average household size in Milton will "track" the average household size that was reported in the 2010 Census. This approach reflects Milton's much higher proportion of single-family households and families with children compared to future, limited, multi-family development. The Milton 2010 Census average household size is divided into the projected Milton popu-

		Avg HH Size -		Occupancy	Total Housing
	Population	Milton	Households	Rate	Units
2010	32,661	2.80	11,659	94.6%	12,328
2014	36,060	2.80	12,872	94.6%	13,611
2015	37,385	2.80	13,345	94.6%	14,111
2016	38,710	2.80	13,818	94.6%	14,611
2017	40,039	2.80	14,293	94.6%	15,113
2018	41,353	2.80	14,762	94.6%	15,609
2019	42,654	2.80	15,226	94.6%	16,100
2020	43,941	2.80	15,686	94.6%	16,586

2034	60,501	2.80	21,597	94.6%	22,836
2035	61,580	2.80	21,982	94.6%	23,243

### Housing Unit Forecasts: 2014-2035

lation each year to arrive at the household forecasts for the project period—2014-2035.

Housing Units are calculated using the city's 2010 housing occupancy rate of 94.6%. That assumes that the city's occupancy rates in the future will be fairly consistent with the rate in 2010, and will remain relatively stable. For comparison, although no Census data is available for housing occupancy in Milton prior to its incorporation, neighboring Alpharetta's occupancy rate in 2010 approximated Milton's at 94.4%, and in 2000 it was 94.8%, reflecting a reliably stable level of housing occupancy over the decade that is indicative of Milton as well.

To arrive at the housing unit estimates each year, the number of households is divided by the occupancy rate.

Source: 2010 City data - 2010 Decennial Census, US Bureau of the Census. 2014-2035 City Population - Build-out Capacity forecast, ROSS+associates.

### Employment

Employment projections begin with ARC's Plan 2040 forecasts which are, of course, only taken down to the Superdistrict level. The following table shows the data from the 2010 Census and for the ARC benchmark years.

Note that 2010 is the first and only year that the Census Bureau has published actual employment figures at the city level. Since these are derived from the "employed persons" data and commuting patterns, second jobs are not counted nor are some sole proprietors, so the real figure would be a bit higher.

Note also that the following table goes out to 2040 because comparisons to the ARC projections are required, and ARC didn't do a 2035 estimate. Forecasts in the final Methodology Report will only go out to 2035.

							2010-2040

### **Employment Forecasts: Benchmark Years**

* Source: 2010 Decennial Census, US Bureau of the Census.

** Source: 2016-2040, Atlanta Regional Commission, Plan 2040 Forecasts.

Two ratios are derived from the 2010 Census data: the percentage of Milton employment in North Fulton County, and the employment-to-households ratio.

- Milton's employment ratio to North Fulton County is held constant and applied to the ARC forecasts for North Fulton in each of ARC's benchmark years.
- Alternately, Milton's 2010 employment-to-household ratio is applied to the projected number of households in Milton (taken from the preceding table).

The Alternate Employment Forecasts table, below, takes the projections for the benchmark years and expands then to cover all years from 2014 to 2035. For the "percentage share" approach, the intervening years between the benchmarks are interpolated using a straight line methodology.

For the Employment-to-Households Ratio approach, the annual household figures are taken from the first table in this report, above. For the last column on the table, the two approaches are averaged to arrive at a "medium" forecast.

	Percenta	ige Share	Emp:H	H Ratio	
	North Fulton	Milton	Milton	Milton	
	County	Employment	Households	Employment	Averaged

2024	172,792	7,887	17,474	10,550	9,219
2025	174,584	7,969	17,908	10,812	9,391
2026	176,760	8,068	18,338	11,071	9,570
2027	178,936	8,167	18,763	11,328	9,748
2028	181,111	8,266	19,183	11,582	9,924
2029	183,287	8,366	19,597	11,831	10,099
2030	185,463	8,465	20,007	12,079	10,272
2031	187,756	8,570	20,412	12,324	10,447
2032	190,049	8,674	20,812	12,565	10,620
2033	192,342	8,779	21,207	12,804	10,792
2034	194,635	8,884	21,597	13,039	10,962
2035	196,928	8,988	21,982	13,271	11,130

### Alternate Employment Forecasts: 2014-2035

Comparing projected employment growth to population growth, the 2014-2035 period anticipates a 70.8% increase in the number of residents (using the Build-out Capacity forecasts). The three alternate employment forecasts laid out on the table above result in the following increases over the 2014-2035 20-year projection period:

	E	mployment Increas	e
	Number of	Percent Increase	Avg Annual
Approach	New Employees	over 2014	Growth Rate
Percentage Share	1,889	26.6%	1.3%
Emp:HH Ratio	5,500	70.8%	3.5%
Averaged	3,695	49.7%	2.5%

### **Alternate Forecast Results**

The percentage share approach understates the city's potential for two reasons: ARC anticipates a 40% employment increase by 2040 over 2010 in the Roswell Superdistrict, but only a 33% increase in the N Fulton Superdistrict (which also includes John's Creek and Alpharetta). Given Milton's relatively superior availability of developable land in the Superdistrict and direct access from Ga 400, a higher percentage would be appropriate. Secondly, as noted in the Population Methodology Appendix, ARC's forecasts are suspected of being inaccurate both countywide (too high) and for the North Fulton County area (too low) when compared to actual figures reported by the Census Bureau.

While the Averaged approach would seem intuitively to be the best choice (threading between the high and the low estimates), the Employment-to-Households Ratio approach appears to be the more realistic for two reasons: it assumes the current ratio will remain in balance with the pace of residential development (i.e., managed growth), and the City's proposed Transfer of Development Rights (TDR) program will allow the use of residential unit transfers to be redeemed as nonresidential floor area instead. This latter factor is important considering the relative constraints on developable land and allowed densities, and on the emphasis being placed by the City on land conservation activities (including the donation of conservation easements that would generate TDRs).

Further, a shift toward more local employment would also support the higher results of the Employment-to-Households Ratio approach. In 2010, 80% of all Milton residents that held jobs commuted out of the city to work, while almost 60% of all employees working in the city commuted in from elsewhere. Thus, in 2010, for each 100 workers in the city, 60 were not city residents. Future job growth would be expected to shift this ratio more toward local employment.

Under continued concerns regarding nonresidential development in the city and to maintain a balanced development pattern, **the Employment-to-Households projection is recommended** for the impact fee calculations.

### Methodology—Trip Generation

In order to calculate new growth and development's fair share of the cost of road improvements, it is necessary to establish how much of the future traffic on Milton's roads will be generated by new growth, over and above the traffic generated by the city's residents and businesses today. This Methodology describes the process through which this determination is made.

### Summary

A Level of Service must be established for road improvements in order to assure that, ultimately, existing development and new growth are served equally. This Section also presents the process through which new growth and development's 'fair share' of road improvement costs is calculated, and a table summarizing the technical portions of this Methodology is included.

### Level of Service

The City has set its Level of Service for road improvements at LOS "D", a level to which it will strive ultimately. However, interim road improvement projects that do not result in a LOS of "D" will still provide traffic relief to current and future traffic alike, and are thus eligible for impact fee funding.

All road improvement projects benefit existing and future traffic proportionally to the extent that relief from over-capacity conditions eases traffic problems for everyone. For example, since new growth by 2035 will represent a certain portion of all 2035 traffic, new growth would be responsible for that portions' cost of the road improvements.

It is noted that the cost-impact of non-Milton generated traffic on the roads traversing the city (cross commutes) is off-set by state and federal assistance. The net cost of the road projects that accrues to Milton reasonably represents (i.e., is 'roughly proportional' to) the impact on the roads by Milton residents and businesses.

The basis for the road impact fee would therefore be Milton's cost for the improvements divided by all traffic in 2035 (existing today plus new growth)—i.e., the cost per trip—times the traffic generated by new growth alone. For an individual land use, the cost per trip (above) would be applied to the number of trips that will be generated by the new development when a building permit is issued, assuring that new growth would only pay its 'fair share' of the road improvements that serve it.

### Approach

This Methodology proceeds along the following lines:

- Total traffic currently generated by Milton residents and businesses on the road system within the city is calculated from trip generation and commuting data for 2010, and extended to 2014.
- Future Milton-generated traffic from new growth in the city is calculated from housing unit and employment forecasts to 2035.
- The portion of total 2035 traffic that is generated by new housing units and employment in the city establishes the maximum percentage of Milton's cost of the future road improvements that can be included in an impact fee.

• Lastly, 'primary' trip ends are calculated as the appropriate connection to actual impact on the city's road network by its existing and future land uses.

### Summary Tables

The first table below shows how the portion of total 2035 traffic generated by new growth (i.e., total trip ends) is calculated.

### Average Daily Trip Ends Generated by New Growth

	2014	2025	Incroaco	Percent New
_	2014	2055	mcrease	Growth Trip Ends
				_
Residential Trip Ends	122,642	200,405	77,763	
Commercial Trip Ends	188,762	322,349	133,587	
Industrial+Utility Trip Ends	3,195	5,461	2,266	
Less: Internal Commutes*	(6,417)	(10,958)	(4,541)	
				JL
-				
	308,182	517,257	209,075	40.4%

* Residents who work in Milton. These trips to and from work are included in the residential trips, above.

The next table, below, calculates the Primary Trip Ends generated by existing and future traffic by deleting pass-by and diverted trips, as discussed below.

### Primary Daily Trip Ends Generated by New Growth

	Percent	Prii	mary Trip End	ls	Percent New
	Primary Trip Ends*	2014	2035	Increase	Growth Primary Trip Ends
					_
Residential Trip Ends	81%	98,913	161,631	62,717	
Commercial Trip Ends	51%	96,047	164,019	67,972	
Industrial+Utility Trip Ends	92%	2,939	5,024	2,085	
Less: Internal Commutes	100%	(6,417)	(10,958)	(4,541)	
					1
		191,482	319,716	128,233	40.1%
*	Derived from	Trip Generatio	n Handbook'	chapter, Trip	<i>Generation</i> , 9th

* Derived from'Trip Generation Handbook' chapter, *Trip Generation*, 9th Edition, Institute of Transportation Engineers.

Overall, new residents and businesses located within Milton in 2035 will generate 40.1% of all Milton traffic on its roads by 2035. Thus, new growth's 'fair share' of the cost to the City to provide road improvements to serve current and future traffic cannot exceed 40.1%.

### Pass-by and Diverted Trips

The impact of new growth and development on Milton's road network is the increased number of vehicles added to the system, expressed by transportation engineers as 'trips'. Every 'trip' has two ends—a beginning at its origin and an end at its destination (known as 'trip ends'). There are three types of trips, defined as:

A Primary Trip (and its trip ends)—a vehicle travelling from its original beginning to its intended final destination. Driving from ones home to ones place of work is an example of a primary trip.

A Pass-by Trip—a vehicle travelling along its usual route from its origin to its final destination, which stops off at an intermediate location for any reason. A trip from home to work that stops along the way for gas, dropping off a child at daycare, picking up coffee or dinner, or for any other reason, represents a 'pass-by' trip at the intermediate location.

A Diverted Trip (previously called a diverted 'link' trip)—a vehicle that diverts from its normal primary trip route between its origin to its final destination, and takes a different route to stop off at an intermediate location for any reason. While a pass-by trip remains on its normal route, a diverted trip changes its route to other streets to arrive at the intermediate stop.

New primary trips add vehicles to the road network. Pass-by and diverted trips involve the same vehicles stopping off between their original beginnings and their final destinations, and therefore do not add new vehicles to the road network—the vehicles were already there on their way to their destinations.

These different types of trips result in different types of 'trip ends'. On a home-to-daycare-to-work trip, for instance, there are two primary trip ends (home and work) and two pass-by or diverted trip ends: arriving at the daycare center and leaving from there to drive to work. The net impact on the road network, however, is created by the one vehicle and its two primary trip ends.

Impact fee calculations take note of these pass-by and diverted trip ends as not adding to the overall traffic on the road network, and deletes them from the total trip ends reported in ITE's *Trip Generation* manual. While the table above uses overall average percentages of primary trip ends derived from ITE for broad land use categories, the actual percentage for each land use listed on the impact fee schedule for roads is applied to the total trip ends to determine the primary trip ends attributed to that land use.

The percentage of 2035 traffic that will be generated by new growth and the increase in primary trip ends from the second table will play an important role in calculating the impact fee eligible amount of road project costs and the per-trip road impact fee.

### **Residential Trip Generation**

Average trip generation rates published by the Institute of Transportation Engineers (ITE) differentiate between 'single-family detached housing' and 'apartments'. The closest correlations with the US Census definitions are 'single-family units' and 'multi-family units', which are shown on the following table.

### Residential Units by Type: 2014 and 2035

	2010	Additional Units*	2014	Increase 2014-2035**	Total in 2035
Single-Family Units	9,912	1,283	11,195	5,933	17,128
Multi-Family Units	2,416	-	2,416	3,200	5,616
Total	12,328	1,283	13,611	9,133	22,744
**	Based on build From Build-ou development o	ling permits iss t Capacity analy density and lan	ued 2010-2013 ysis of land ava id conservatio	3, adjusted to 20 ailability and Ci n initiatives.	)14 total. ty policies on

The 2010 breakdown of housing units by type on the table above are taken from the 2010 Census. These numbers are extended to the number of housing units projected in 2014 (in a previous paper), combining the number of housing units authorized by building permits between 2010 and 2013 with adjustments to reach the 2014 projected total. The 9,133 new housing units forecast for the 2014-2035 period is taken from the Build-out Capacity population scenario.

The next table, below, calculates the amount of traffic that is generated by the city's housing stock today, and the amount that will be generated in 2035.

	ADT* Trip Ends	2014 Units	2014 ADT Trip Ends		2035 Units	2035 ADT Trip Ends	Increase 2014-2035	Percent New Growth Trip Ends
Single-Family Units Multi-Family Units	9.52 6.65	11,195 2,416	106,576 16,066		17,128 5,616	163,059 37,346	56,483 21,280	
Total		13,611	122,642	-	22,744	200,405	77,763	38.8%

### Residential Trip Generation: 2014-2035 New Growth Increase

* Average Daily Traffic (trip ends) on a weekday; Institute of Transportation Engineers *Trip Generation*, 9th Edition. Total includes trips to/from work.

The calculations are made on the basis of 'average daily traffic' on a normal weekday, using average trip generation rates derived through multiple traffic studies (350 for single-family and 86

for apartments) and published by ITE. The rates are expressed for 'trip ends'—that is, traffic both leaving and coming to a housing unit.

Comparing traffic in 2014 to 2035, the future increase in trips can be calculated, which will represent 38.8% of all residential trip ends generated in the city.

It should be noted that the traffic generated by housing units includes trips to and from work and, more particularly, residents who work at a business within the city.

### Nonresidential Trip Generation

Calculating traffic generated by businesses located in Milton is more problematical than residential trips because there is no breakdown of types of businesses in the city that is readily available. In addition, while employment forecasts have been made in terms of the number of jobs, there is no data available for floor areas, much less by detailed type of use.

The alternate is to view nonresidential traffic generation on a broad 'average' basis. For this, there is data available from ITE for a number of individual uses relating to the total number of trips generated per employee. These trips, of course, include not only trips taken by the employee (to/from work, lunch, etc.) but also customers and others that are attracted to the use or serve it in some way.

The following table shows the 'trips per employee' for those uses for which impact fees are commonly collected and for which the data is available.

### ITE Trips-per-Employee Data

			ADT		Average	Average
	ITE CODE	LAND USE	Trip Ends per Employee		by Category	All Commercial
Port and Terminal (000-099)	30	Intermodal Truck Terminal	6.99

Services (900-999)	912	Drive-in Bank	30.94			
		OVERALL AVERAGE	23.01			

Source: Trip Generation, 9th Edition, Institute of Transportation Engineers, where survey results given for key land uses.

Overall, the average trip generation rate of all uses listed is 23.01 trips per employee. The table also shows average rates by category (truck terminals are included with 'industrial' and drive-in banks are included with 'retail' uses). The last column shows the average rate for all 'commercial' uses listed, as opposed to the 'industrial' uses shown in the column on its left.

We know from the 2010 Census how many people work in Milton based on commuting patterns. The next table provides a breakdown between commercial and industrial employment in the city and calculates trip ends generated by each.

### Nonresidential Trip Generation: 2010 Census

Tax base valuations give us some clue as to the breakdown. When the City's 'industrial' and 'utility' tax valuations are combined, the figures suggest that 96% of all uses are 'commercial' in nature, while the remaining 4% is industrial. These percentages, applied to total employment in Milton, give us the number of employees in 2010 in each category.

The upper portion of the table calculates the total number of trips using the average rates for commercial and industrial from the previous table. From the total of all nonresidential trips is deducted the number of trips to/from work generated by city residents, since these trips have already been calculated as part of the residential trip generation rates.

For comparison, the lower part of the table calculates all trips using the overall average for all uses, regardless of type.

Lastly, the following table calculates the total number of trip ends that will be generated by new nonresidential growth in future traffic on Milton's roads.

### Nonresidential Trip Generation: 2014-2035 New Growth Increase

The table shows the number of trip ends currently generated by Milton businesses based on 2014 employment. The trip ends by use are distributed using the same percentages calculated on the previous table. The same calculations are made for the year 2035 based on projected employment in the city, and the difference between 2014 and 2035 represents trip ends generated by future growth and development. This totals 41.4% of all nonresidential 2035 trip ends.

The results of the residential and nonresidential trip generation analyses are combined on the Summary table at the beginning of this Methodology for an overall calculation of new growth's share of future traffic generated by Milton residents and businesses. From these figures, pass-by and diverted trip ends will be deleted to determine primary trip ends, which more closely relates to vehicles on the road and thus contribute to traffic congestion.

### Terminology

This Methodology uses the term 'average daily traffic' (ADT) for a weekday, which is defined by ITE as the 'average weekday vehicle trip ends', which are "the average 24-hour total of all vehicle trips counted from a study site from Monday through Friday."

Additionally, ITE defines a 'trip or trip end' as "a single or one-direction vehicle movement with either the origin or the destination (exiting or entering) inside a study site. For trip generation purposes, the total trip ends for a land use over a given period of time are the total of all trips entering plus all trips exiting a site during a designated time period".

Lastly, ITE defines 'average trip rate' as "the weighted average of the number of vehicle trips or trip ends per unit of independent variable (for example, trip ends per occupied dwelling unit or employee) using a site's driveway(s). The weighted average rate is calculated by dividing the sum of all independent variable units where paired data is available. The weighted average rate is used rather than the average of the individual rates because of the variance within each data set or generating unit. Data sets with a large variance will over-influence the average rate if they are not weighted".
