A & R Project # 15-123

EXECUTIVE SUMMARY

Traffic impacts were evaluated for the added traffic from the proposed Henry Promenade mixed-used development located to the east of I-75 between Jonesboro Road and Mt. Carmel Road in McDonough, Georgia. The development will consist of:

- Total Retail: 763,500 sf
- Hotel 1: 120 rooms
- Hotel 2: 100 rooms

The development proposes one full-access driveway as well as two right-in/right-out driveways on Jonesboro Road, and one full-access driveway as well as one right-in/right-out driveway on Mt. Carmel Road. Existing and future operations after completion of the project were analyzed at the intersections of:

- Jonesboro Road @ I-75 Southbound Ramps
- Jonesboro Road @ I-75 Northbound Ramps
- Jonesboro Road @ Foster Drive
- Jonesboro Road @ North Bridges Road/Bojangle's Driveway
- Jonesboro Road @ Mt. Carmel Road
- Jonesboro Road @ Oak Grove Road/Willow Lane
- Jonesboro Road @ Kelly Road
- Mt. Carmel Road @ North Bridges Road/Sterling Place
- Mt. Carmel Road @ Mill Road

The analysis included the evaluation of Future operations for "No-Build" and "Build" conditions, both of which account for increases in annual growth of through traffic and added traffic from other nearby planned developments. The resulting recommendations from each analysis are listed below:

System Recommendations and Improvements

Improvements that are identified as "System Improvements" address deficiencies that are found within the existing road network prior to any impacts from the proposed development's added traffic and are taken under consideration by the local municipality. A summary of the system improvements is provided below with more detailed information on each intersection in the following narratives.

Jonesboro Road @ I-75 SB Ramps

The existing conditions analysis for the intersection of Jonesboro Road at I-75 SB Ramps indicates the southbound approach (I-75 Ramp) is currently operating at a level-of-service "E" in the Saturday peak hour before the addition of site traffic. It is recommended that the existing southbound shared through/left turn lane be restriped to accommodate through/left/right turn movements. This will allow more stacking for the southbound right turn movements.

Jonesboro Road @ I-75 NB Ramps

The queue for the westbound right turn movement is currently extending beyond the available storage in the AM peak hour. In order to accommodate the amount of stacking for the westbound right turn

movement, it is recommended that the existing right turn lane be extended through to the next intersection.

Jonesboro Road@ Foster Drive/Managed Lanes Access

In order to accommodate the extended westbound right turn lane and right turn queue at the adjacent intersection of Jonesboro Road at I-75 NB Ramps, it is recommended that the existing dedicated westbound right turn lane be converted to operate as a shared through/right turn lane.

Jonesboro Road at Oak Grove Road/Willow Lane

The intersection of Jonesboro Road at Oak Grove Road/Willow Lane is currently operating at an acceptable level-of-service ("D" or better) during the AM, PM, and Saturday peak hours. After accounting for growth of background traffic, the intersection will begin to operate at a level-of-service "E" in the AM peak hour. In order to bring the level-of-service to the accepted threshold "D", it is recommended that the southbound approach be shifted to the east in order to accommodate a dedicated right turn lane, and extend the northbound left turn lane storage to 500' of full-width storage by restriping the existing gored area in the median. It is also recommended that protected + permissive signal phasing be installed for the northbound and southbound left turn movements.

Jonesboro Road at N. Bridges Road/Bojangle's Driveway

The side-street approaches to the intersection of Jonesboro Road at N. Bridges Road/Bojangle's Driveway are currently operating below an acceptable level-of-service ("E" or better). As this is an existing condition and the only improvement needed is for the southbound right movement, which is offsite and out of public right-of way, no reasonable improvements have been identified.

Mt. Carmel Road at Mill Road

One or more approaches to the intersection of Mt. Carmel Road at Mill Road will begin to operate below an acceptable level-of-service ("D" or better) after accounting for growth of background traffic. Due to the intersection being all-way stop-controlled, and because queuing on each approach will not block other nearby intersections, no reasonable improvements have been identified at the intersection.

Summary of Recommended System Improvements

- Shift the southbound approach to the intersection of Jonesboro Road at Oak Grove Road/Willow Lane to the east in order to install a dedicated southbound right turn lane with 100' storage and a 75' taper and install protected + permissive signal phasing.
- Extend the northbound left turn lane at the above intersection to 500' of storage by restriping the existing gore area within the median and install protected + permissive signal phasing.
- It is recommended that the existing southbound through/left lane at the intersection of Jonesboro Road at I-75 SB Ramps be restriped to accommodate a through/left/right movement.
- It is recommended the existing westbound right turn lane at the intersection of Jonesboro Road at I-75 NB Ramps be extended through to the next intersection (Jonesboro Road at Foster Drive/Managed Lanes Access), replacing the existing dedicated westbound right turn lane at the Jonesboro Road at Foster Drive/Managed Lanes Access intersection with a shared through/right turn lane.

Site Access Configuration

The following access configuration was utilized when modeling the proposed site driveway intersections.

- Site Driveway #1: Full-access driveway on Jonesboro Road
 - This driveway will consist of two entering lanes and two exiting lanes.
 - The intersection will be controlled by an actuated traffic signal with a permissive + protected phase for the eastbound and westbound left turn movements.
 - Entering left turn movements will be made from a dedicated westbound left turn lane.
 - Entering right turn movements will be made from a dedicated eastbound deceleration lane.
- Site Driveway #2: Right-in/right-out driveway on Jonesboro Road
 - This driveway will consist of one entering and one exiting lane.
 - The intersection will be unsignalized with a YIELD sign on the northbound approach.
 - A deceleration lane will be constructed for entering traffic based on local standards.
- Site Driveway #3: Full-access driveway on Mt. Carmel Road
 - This driveway will consist of one entering lane and two exiting lanes. The southbound (driveway) approach will have a left turn and right turn lane for exiting traffic.
 - The intersection will be controlled by an actuated traffic signal.
 - Entering left turn movements will be made from a dedicated eastbound left turn lane.
 - Entering right turn movements will be made from a dedicated westbound deceleration lane.
- Site Driveway #4: Right-in/right-out driveway on Mt. Carmel Road
 - This driveway will consist of one entering lane and one exiting lane.
 - The intersection will be unsignalized with a YIELD sign on the southbound approach.
 - A westbound deceleration lane will be constructed for entering traffic based on local standards.
- Site Driveway #5: Right-in/right-out driveway on Jonesboro Road
 - This driveway will consist of one entering lane and one exiting lane.
 - The intersection will be unsignalized with a YIELD sign on the southbound approach.
 - An eastbound deceleration lane will be constructed for entering traffic based on local standards.

Site Mitigation Improvements

Improvements that are identified as mitigation improvements address deficiencies that are caused by site traffic and can be identified as related to the proposed development. A summary of the site mitigation improvements is provided below, with more detailed information on each intersection in the following narratives.

Jonesboro Road@ Foster Drive/Managed Lanes Access

Because a third eastbound through lane on Jonesboro Road is recommended beginning at this intersection, it is recommended dual rights on the northbound approach (Managed Lanes Access) be reconfigured to operate with one free-flow right turn and one yield-controlled right turn lane. A concept of this recommendation is included in the Appendix.

Jonesboro Road @ Mt. Carmel Road

Due to the large number of northbound right turns after the addition of site traffic, it is recommended that the existing northbound right turn operate with dual right turns and given permissive + overlap signal phasing.

Mt. Carmel Road at Mill Road

One or more approaches to the intersection of Mt. Carmel Road at Mill Road will continue to operate below an acceptable level-of-service ("D" or better) after accounting for site-generated traffic. Due to the intersection being all-way stop-controlled, and because queuing on each approach will not block other nearby intersections, no reasonable improvements have been identified at the intersection.

Jonesboro Road @ Site Driveway 1

The Future "Build" 2020 conditions analysis for Jonesboro Road at Site Driveway 1 indicates the intersection will operate at an overall level-of-service "F" during the PM and Saturday peak hours. It is recommended that dual left turn lanes be constructed for the westbound and northbound approaches and operate with protected signal phasing. To relieve congestion on the eastbound through movement, it is recommended a third through lane be constructed along the site frontage beginning at the intersection of Jonesboro Road at Foster Drive/Managed Lane Access through to drop as a right turn lane at the eastern right-in/right-out driveway (Site Driveway 5) on Jonesboro Road. Although this improvements will not bring the overall level-of-service to within the "D" threshold during the Saturday peak hour, the recommended improvements will reduce the overall delay at the intersection by more than 274 seconds/vehicle. As these delays will only be experienced during one peak hour out of the week, no further improvements are feasible at the intersection.

Summary of Recommended Site Mitigation Improvements

- Recommended system improvements (previous section) are also applicable as mitigation improvements.
- It is recommended a third through lane be constructed on Jonesboro Road along the site frontage beginning at the intersection of Jonesboro Road at Foster Drive/Managed Lanes Access through to drop as a right turn lane at the eastern right-in/right-out driveway (Site Driveway 5) on Jonesboro Road.
- It is recommended the northbound dual rights at the intersection of Jonesboro Road at Foster Drive/Managed Lanes Access be reconfigured to operate with one free-flow right turn and one yield-controlled right turn.
- It is recommended northbound dual right turn lanes be added to the intersection of Jonesboro Road at Mt. Carmel Road and given permissive + overlap signal phasing.
- It is recommended westbound and northbound dual left turn lanes be constructed at the intersection of Jonesboro Road at Site Driveway 1 and given protected signal phasing.

INTRODUCTION

The purpose of this study is to determine the traffic impact that will result from the proposed Henry County Promenade mixed-used development located to the east of I-75 between Jonesboro Road and Mt. Carmel Road in McDonough, Georgia. The development will consist of:

- Total Retail: 763,500 sf
- Hotel 1: 120 rooms
- Hotel 2: 100 rooms

The development proposes access at the following locations:

- Site Driveway 1: Full-access driveway on Jonesboro Road
- Site Driveway 2: Right-in/right-out driveway on Jonesboro Road
- Site Driveway 3: Full-access driveway on Mt. Carmel Road
- Site Driveway 4: Right-in/right-out driveway on Mt. Carmel Road

The AM, PM, and Saturday peak hours have been analyzed in this study. In addition to the site access points, this study includes the evaluation of traffic operations at the intersections of:

- Jonesboro Road @ I-75 Southbound Ramps
- Jonesboro Road @ I-75 Northbound Ramps
- Jonesboro Road @ Foster Drive
- Jonesboro Road @ North Bridges Road/Bojangle's Driveway
- Jonesboro Road @ Mt. Carmel Road
- Jonesboro Road @ Oak Grove Road/Willow Lane
- Jonesboro Road @ Kelly Road

- Mt. Carmel Road @ North Bridges Road/Sterling Place
- Mt. Carmel Road @ Mill Road

Recommendations to improve traffic operations have been identified as appropriate and are discussed in detail in the following sections of the report.

STUDY NETWORK DETERMINATION

The study network was determined by evaluating the amount of traffic that the proposed development will add to each roadway segment in the area. According to GRTA requirements, a roadway segment carries a “significant” amount of traffic if the project contributes 7% or more trips to the two-way daily service volumes of the roadway at the appropriate level of service standard. Upon agreement with GRTA a level of service standard of “D” was used for determining the study area network.

The traffic generated by the proposed project was then assigned to the area roadways using the trip distribution to determine the site-generated traffic on each roadway segment. The boundaries of the study network extend to the most distant intersections where at least 7% of the service volumes on the segment are attributed to project traffic. The following study intersections fell within the 7% rule and/or have been selected as being suitable for evaluation in discussions with GRTA, GDOT and Henry County:

1. Jonesboro Road @ I-75 Southbound Ramps
2. Jonesboro Road @ I-75 Northbound Ramps
3. Jonesboro Road @ Foster Drive
4. Jonesboro Road @ North Bridges Road/Bojangle's Driveway
5. Jonesboro Road @ Mt. Carmel Road
6. Jonesboro Road @ Oak Grove Road/Willow Lane
7. Jonesboro Road @ Kelly Road
8. Mt. Carmel Road @ North Bridges Road/Sterling Place
9. Mt. Carmel Road @ Mill Road

The location of the development and the surrounding study network is shown in Figure 1. Other intersections within this corridor, such as unsignalized side streets, right-in/right-out driveways or private driveways have not been included in the study network.

Existing Roadway Facilities

The following is a brief description of each of the roadway facilities located in proximity to the site:

Jonesboro Road

Jonesboro Road is an east-west, four-lane, median-divided roadway with a posted speed limit of 45 mph in the vicinity of the site. GDOT traffic counts (Station IDs 1510212 & 1510214) indicate that the daily traffic volume on Jonesboro Road is 17,400 vehicles per day east of Vinings Drive and 25,000 vehicles per day west of Mt. Carmel Road. GDOT classifies Jonesboro Road as a Minor Arterial roadway.

Interstate 75

Interstate 75 is a north-south, six-lane, divided roadway with a posted speed limit of 65 mph in the vicinity of the site. GDOT traffic counts (Station IDs 1510406 & 1510408) indicate that the daily traffic volume on Interstate 75 is 124,000 vehicles per day south of Jonesboro Road and 140,000 vehicles per day north of Jonesboro Road.

GDOT Project PI 0009156, paired with GDOT Project PI 0009157, will construct a reversible, barrier-separated, managed lane system and Intelligent Transportation System infrastructure along I-75 in Henry and Clayton Counties. The managed lanes begin approximately 600 feet south of SR 138 (Stockbridge Highway) on I-75 and at SR 138 on I-675, and end at SR 155 on I-75, for a total length of 12.24 miles. From SR 155 to approximately 1 mile south of Mt. Carmel Road, the managed lane system will consist of one reversible lane transitioning to two reversible lanes. As construction of the project will be completed before construction of the proposed development, the modification to the study network has been included in the impact analysis of the Future “No-Build” and Future “Build” conditions.

Foster Drive

Foster Drive is a north-south, two-lane roadway with a posted speed limit of 30 mph in the vicinity of the site.

North Bridges Road

North Bridges Road is a north-south, unpaved roadway with no posted speed limit. The developer has applied for abandonment of North Bridges Road as well as the adjacent Commercial Drive and believes Henry County will consent.

Mt. Carmel Road

Mt. Carmel Road is a north-south, two-lane roadway with a posted speed limit of 45 mph in the vicinity of the site. GDOT traffic counts (Station ID 1517408) indicate that the daily traffic volume on Mt. Carmel Road is 3,720 vehicles per day south of Jonesboro Road. GDOT classifies Mt. Carmel Road as a Major Collector roadway.

As part of the GDOT Projects PI 0009156 and PI 0009157, the Mt. Carmel Road bridge over I-75 will be replaced with a new one. Due to this construction, Mt. Carmel Road is currently closed to all but local traffic between Mill Road and Jonesboro Road. Moreover, after completion of the GDOT project, the existing unsignalized intersection of Jonesboro Road at Mt. Carmel Road will be converted to a signalized intersection.

Oak Grove Road

Oak Grove Road is a north-south, two-lane roadway with a posted speed limit of 45 mph in the vicinity of the site. GDOT traffic counts (Station ID 1510501) indicate that the daily traffic volume on Oak Grove Road is 4,020 vehicles per day south of Foster Drive. GDOT classifies Oak Grove Road as a Major Collector roadway.

Willow Lane

Willow Lane is a north-south, two-lane, median-divided roadway with a posted speed limit of 45 mph in the vicinity of the site.

Kelly Road

Kelly Road is a north-south, two-lane roadway with a posted speed limit of 35 mph in the vicinity of the site.

Mill Road

Mill Road is a north-south, two-lane roadway with a posted speed limit of 45 mph in the vicinity of the site. GDOT traffic counts (Station IDs 1518135 & 1518134) indicate that the daily traffic volume on Mill Road is 7,480 vehicles per day south of Jonesboro Road and 4,770 vehicles per day south of Mt. Carmel Road. GDOT classifies Mill Road as a Local roadway.

Sterling Place

Sterling Place is a north-south, 450 foot, dead-end roadway with no posted speed limit.

Existing Bicycle and Pedestrian Facilities

The following is a brief description of each of the bicycle and pedestrian facilities located in proximity to the site:

Nearby local or regional trails

There is no trail located near the study area.

Bicycle paths or sidewalks

Sidewalks and pedestrian facilities are present along the following roadways in the study network:

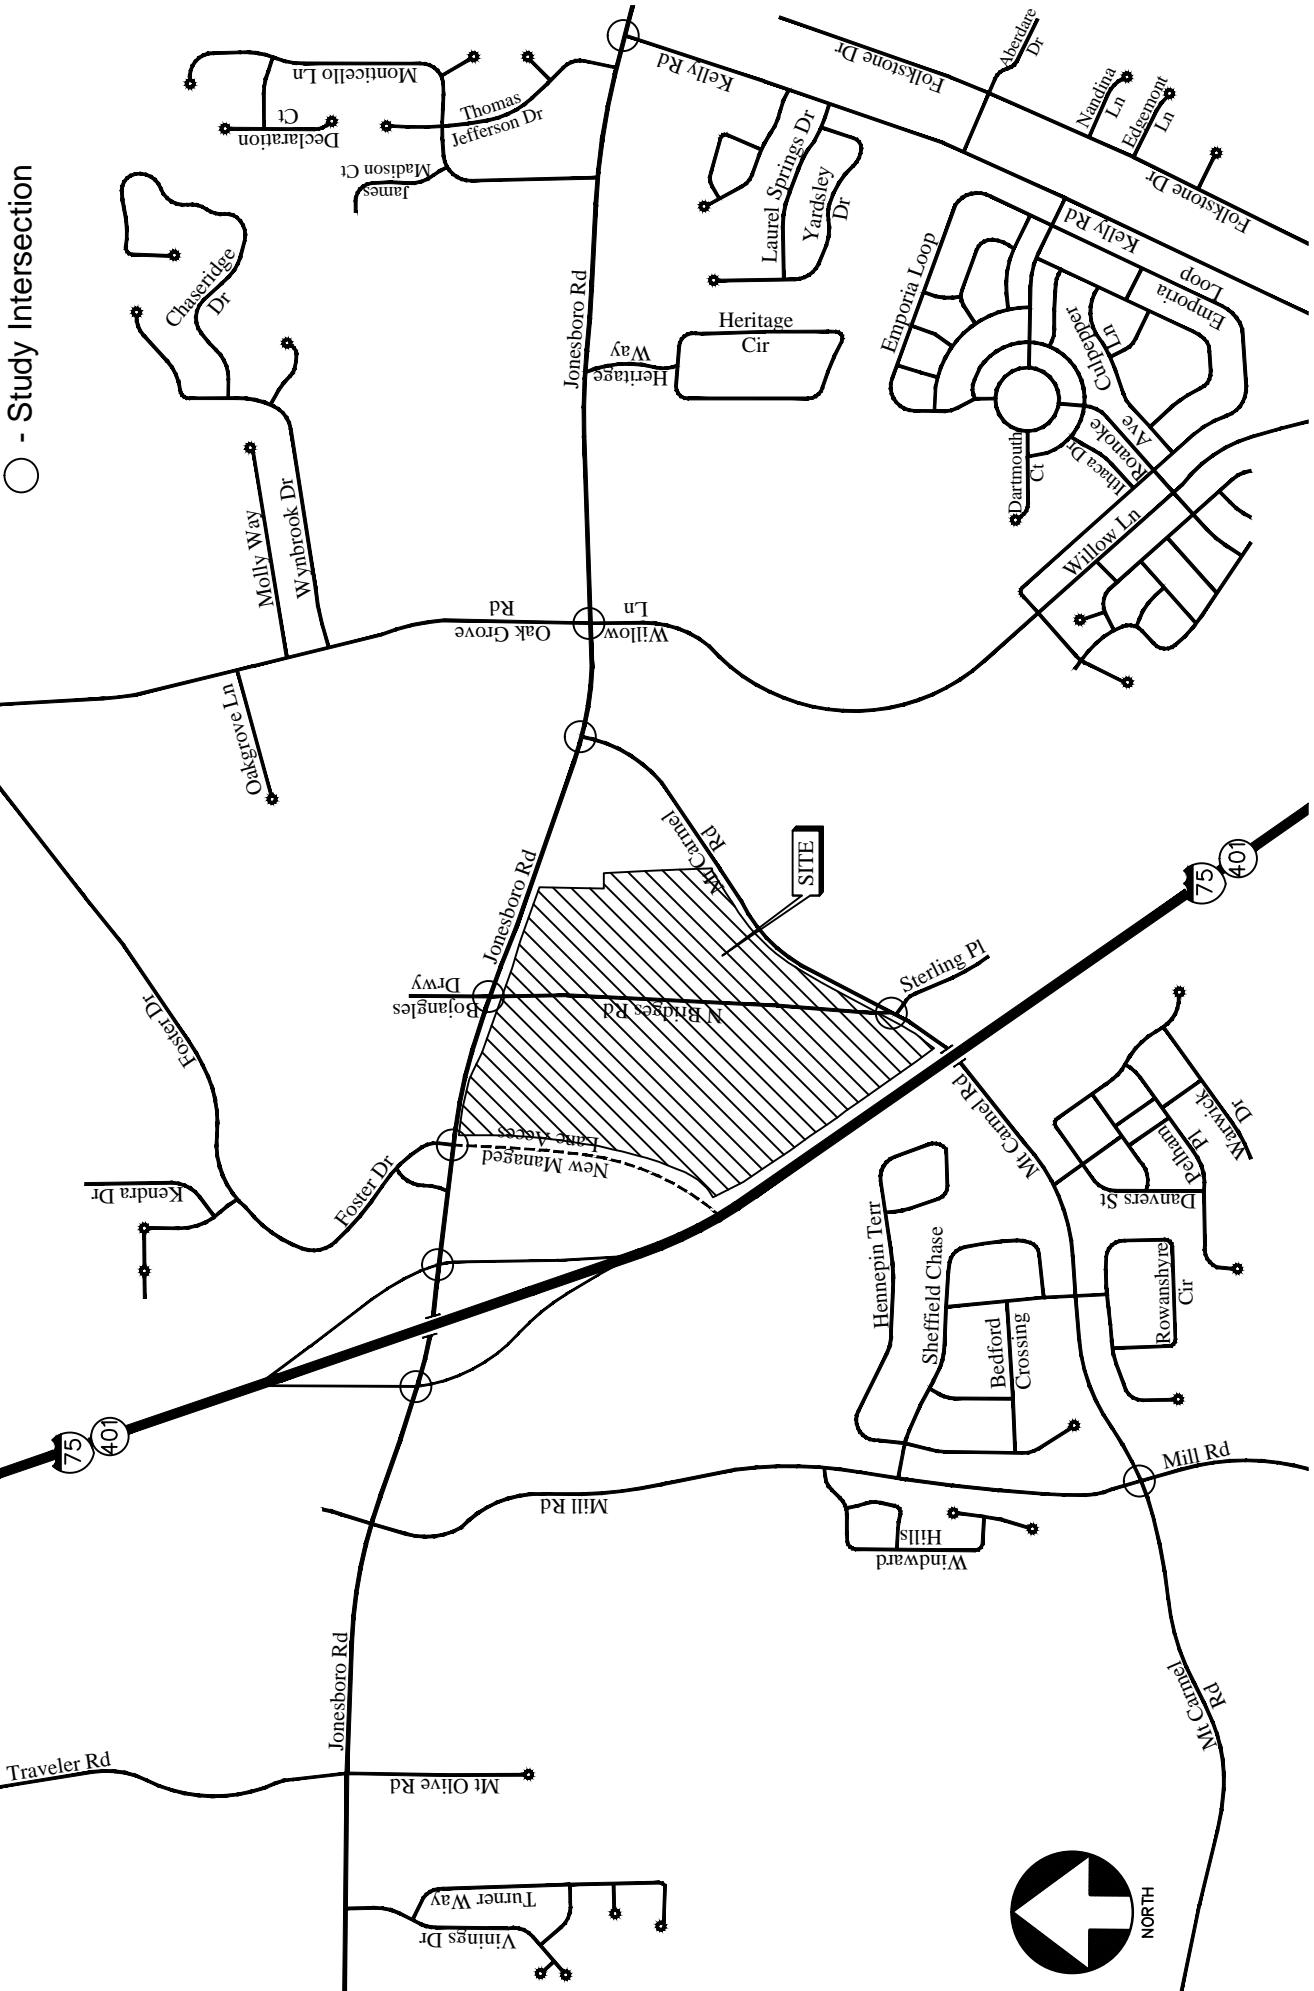

- Willow Lane: East side of the road, between Jonesboro Road and Bridges Road.

Bike paths are not present in the study area.

Existing Transit Facilities

There is no public transit service near the site.

LEGEND

LOCATION MAP AND STUDY INTERSECTIONS

STUDY METHODOLOGY

In this study, the methodology used for evaluating traffic operations at each of the subject intersections is based on the criteria set forth in the Transportation Research Board's Highway Capacity Manual, 2000 edition (HCM 2000). Synchro software, which utilizes the HCM 2000 methodology, was used for the analysis. The following is a description of the methodology employed for the analysis of unsignalized and signalized intersections.

Unsignalized Intersections

For unsignalized intersections at which the side street or minor street is controlled by a stop sign, the criteria for evaluating traffic operations are the level-of-service (LOS) for the turning movements at the intersection and the level-of-service for the overall intersection. Level-of-service is based on the average controlled delay incurred at the intersection. Controlled delay for unsignalized intersections includes initial deceleration delay, queue move-up time, stopped delay, and final acceleration delay. Several factors affect the controlled delay for unsignalized intersections, such as the availability and distribution of gaps in the conflicting traffic stream, critical gaps, and follow-up time for a vehicle in the queue.

Level-of-service is assigned a letter designation from "A" through "F". Level-of-service "A" indicates excellent operations with little delay to motorists, while level-of-service "F" exists when there are insufficient gaps of acceptable size to allow vehicles on the side street to cross safely, resulting in extremely long total delays and long queues. The level-of-service criteria for two-way stop-controlled and all-way stop-controlled (unsignalized) intersections are given in Table 1.

TABLE 1 — LEVEL-OF-SERVICE CRITERIA FOR UNSIGNALIZED INTERSECTIONS

Level-of-service	Average Delay (sec)
A	≤ 10
B	> 10 and ≤ 15
C	> 15 and ≤ 25
D	> 25 and ≤ 35
E	> 35 and ≤ 50
F	> 50

Source: 2000 Highway Capacity Manual

Signalized Intersections

For signalized intersections, it is necessary to evaluate both capacity and level-of-service in order to evaluate the overall operation of the intersection. The capacity analysis of an intersection is performed by comparing the volume of traffic using the various lane groups at the intersection to the capacity of those lane groups. This results in a volume/capacity (v/c) ratio for each lane group. A v/c ratio greater than 1.0 indicates that the volume of traffic has exceeded the capacity available, resulting in a temporary excess of demand. Although the capacity of the entire intersection is not defined, a composite v/c ratio for the sum of the critical lane groups within the intersection is computed. This composite v/c ratio is an indication of the overall intersection sufficiency.

Level-of-service for a signalized intersection is defined in terms of average controlled delay per vehicle, which is composed of initial deceleration delay, queue move-up time, stopped delay, and final acceleration delay. The level-of-service criteria for signalized intersections, based on average controlled delay, are shown in Table 2. Level-of-service "A" indicates operations with very low controlled delay, while level-of-service "F" describes operations with extremely high average controlled delay. Level-of-service "E" is typically considered to be the limit of acceptable delay, and level-of-service "F" is considered unacceptable by most drivers.

TABLE 2 — LEVEL-OF-SERVICE CRITERIA FOR SIGNALIZED INTERSECTIONS

Level-of-service	Average Control Delay (sec)
A	≤ 10
B	$> 10 \text{ and } \leq 20$
C	$> 20 \text{ and } \leq 35$
D	$> 35 \text{ and } \leq 55$
E	$> 55 \text{ and } \leq 80$
F	> 80

Source: 2000 Highway Capacity Manual

EXISTING TRAFFIC ANALYSIS

Existing traffic counts and intersection geometric data were obtained at the following study intersections:

- Jonesboro Road @ I-75 Southbound Ramps
- Jonesboro Road @ I-75 Northbound Ramps
- Jonesboro Road @ Foster Drive
- Jonesboro Road @ North Bridges Road/Bojangle's Driveway
- Jonesboro Road @ Mt. Carmel Road
- Jonesboro Road @ Oak Grove Road/Willow Lane
- Jonesboro Road @ Kelly Road
- Mt. Carmel Road @ North Bridges Road/Sterling Place
- Mt. Carmel Road @ Mill Road

Turning movement counts were collected on Thursday, November 19, 2015 and Saturday, November 21, 2015. All weekday turning movement counts were recorded during the AM and PM peak hours between 7:00 a.m. to 9:00 a.m. and 4:00 p.m. to 6:00 p.m., respectively. All weekend turning movement counts were recorded during the Saturday peak hour between 12:00 p.m. and 2:00 p.m. The four consecutive 15-minute interval volumes that summed to produce the highest volume at the intersections were then determined. These volumes make up the peak hour traffic volumes for the intersections counted and are shown in Figure 2.

Existing Traffic Operations

Existing traffic operations were analyzed at the study intersections in accordance with the HCM methodology. A queue length analysis was also performed. The results of the analyses are shown in Tables 3 and 4. The existing traffic control and lane geometry for the intersections are shown in Figure 3.

TABLE 3 – EXISTING INTERSECTION OPERATIONS

The results of existing traffic operations analysis indicates that one or more approaches to stop-controlled side-streets are operating at level-of-service "E" or "F" during each peak hour. These areas are addressed in the Future Traffic Operations section.

EXISTING TRAFFIC CONTROL AND LANE GEOMETRY

FIGURE 3

PROJECT DESCRIPTION

The proposed site will be located to the east of I-75 between Jonesboro Road and Mt. Carmel Road in McDonough, Georgia. The development will consist of:

- Total Retail: 763,500 sf
- Hotel 1: 120 rooms
- Hotel 2: 100 rooms

The development proposes access at the following locations:

- Site Driveway 1: Full-access driveway on Jonesboro Road
- Site Driveway 2: Right-in/right-out driveway on Jonesboro Road
- Site Driveway 3: Full-access driveway on Mt. Carmel Road
- Site Driveway 4: Right-in/right-out driveway on Mt. Carmel Road
- Site Driveway 5: Right-in/right-out driveway on Jonesboro Road

Site Plan

A site plan is shown in Figure 4. A larger size drawing and a digital copy of the site plan are also provided with this report.

Planned Bicycle and Pedestrian Facilities

The on and/or off-site provisions for non-motorized travel included in the planned construction of the proposed development are as follows:

- The proposed development will be comprised of hotel and retail uses. Pedestrian connections are proposed between the mixed-uses on the site.

Planned Transit Facilities

There is no public transit service near the site.

Consistency with Adopted Comprehensive Plan

The following is an explanation as to how the proposed DRI relates to the local government's Comprehensive Plan in particular the transportation and capital improvements element, and any transportation improvements listed in the Short-Term Work Program(s) within the vicinity of the DRI. Henry County lists Jonesboro Road to the west of I-75 as a future road widening or new roadway project in the 2007 Joint County/Cities Comprehensive Transportation Plan (JCTP).

Project Phasing

A phasing schedule shall be provided for any proposed DRIs involving multiple phases. The phasing schedule shall include the types and amounts of land uses to be developed and should be identified by phase, the site location of each land use by phase, the amenities to be developed with each phase, and all transportation elements. The transportation elements shall focus upon infrastructure in place, access to the development, and internal mobility during each phase analyzed. This project has been evaluated for the complete build-out of the development in 2020.

Trip Generation

Trip generation estimates for the project were based on the rates and equations published in the 9th edition of the Institute of Transportation Engineers (ITE) Trip Generation report. This reference contains traffic volume count data collected at similar facilities nationwide. The trip generation was based on the following ITE Land Uses: 310 – Hotel and 820 – Shopping Center. Due to the nature of the development, pass-by and mixed-use reductions have been applied per ITE standards. The calculated total trip generation for the proposed development is shown in Table 5, and Table 6 shows the total Saturday peak hour trip generation.

TABLE 5 – TRIP GENERATION

Land Use	Size	AM Peak Hour			PM Peak Hour			24-Hour
		Enter	Exit	Total	Enter	Exit	Total	Two-way
ITE 820 – Shopping Center	763,500 sf	334	205	539	1,123	1,216	2,339	25,454
	<i>Mixed-use Reduction</i>	-25	-21	-46	-34	-21	-55	-566
	<i>Pass-by Trips (0%) 34%</i>	0	0	0	-370	-406	-776	-7,760
ITE 310 – Hotel	220 rooms	69	48	117	67	65	132	1,596
	<i>Mixed-use Reduction</i>	-21	-25	-46	-21	-34	-55	-566
	Total Trips (without Reductions)	403	253	656	1,190	1,281	2,471	27,050
	New External Trips (with Reductions)	357	207	564	765	820	1,585	18,158

*pass-by trips (AM) PM; 24-hour pass-by trips estimated by considering PM pass-by as 10% of daily

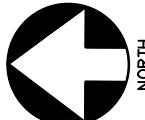

TABLE 6 – TRIP GENERATION (SATURDAY PEAK HOUR)

Land Use	Size	Saturday Peak Hour		
		Enter	Exit	Total
ITE 820 – Shopping Center	763,500 sf	1,704	1,573	3,277
	<i>Mixed-use Reduction</i>	-37	-27	-64
	<i>Pass-by Trips 26%</i>	-433	-402	-835
ITE 310 – Hotel	220 rooms	87	69	156
	<i>Mixed-use Reduction</i>	-27	-37	-64
	Total Trips (without Reductions)	1,791	1,642	3,433
	New External Trips (with Reductions)	1,294	1,176	2,470

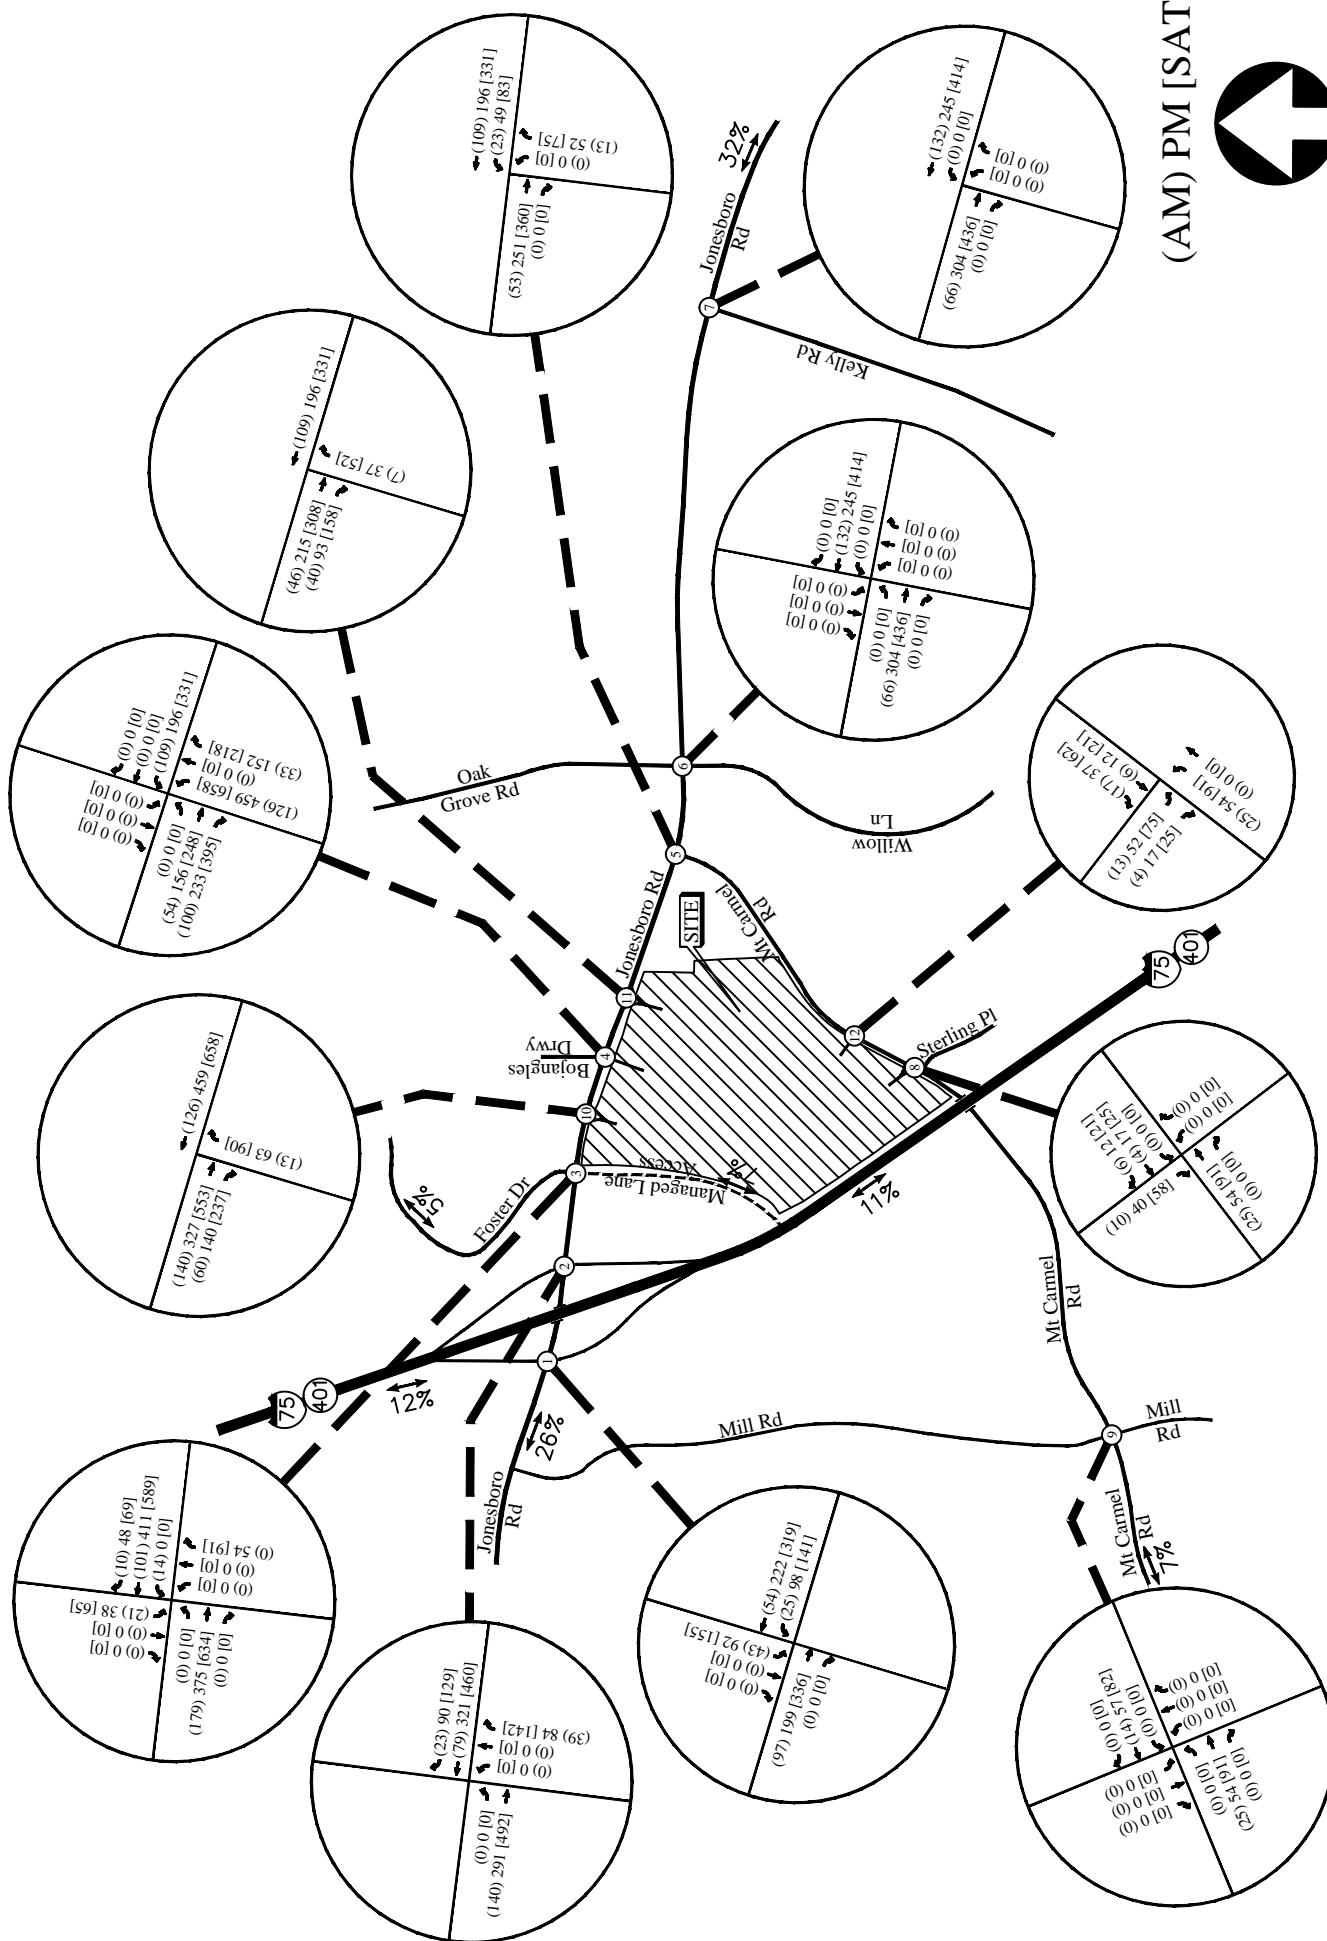

Trip Distribution

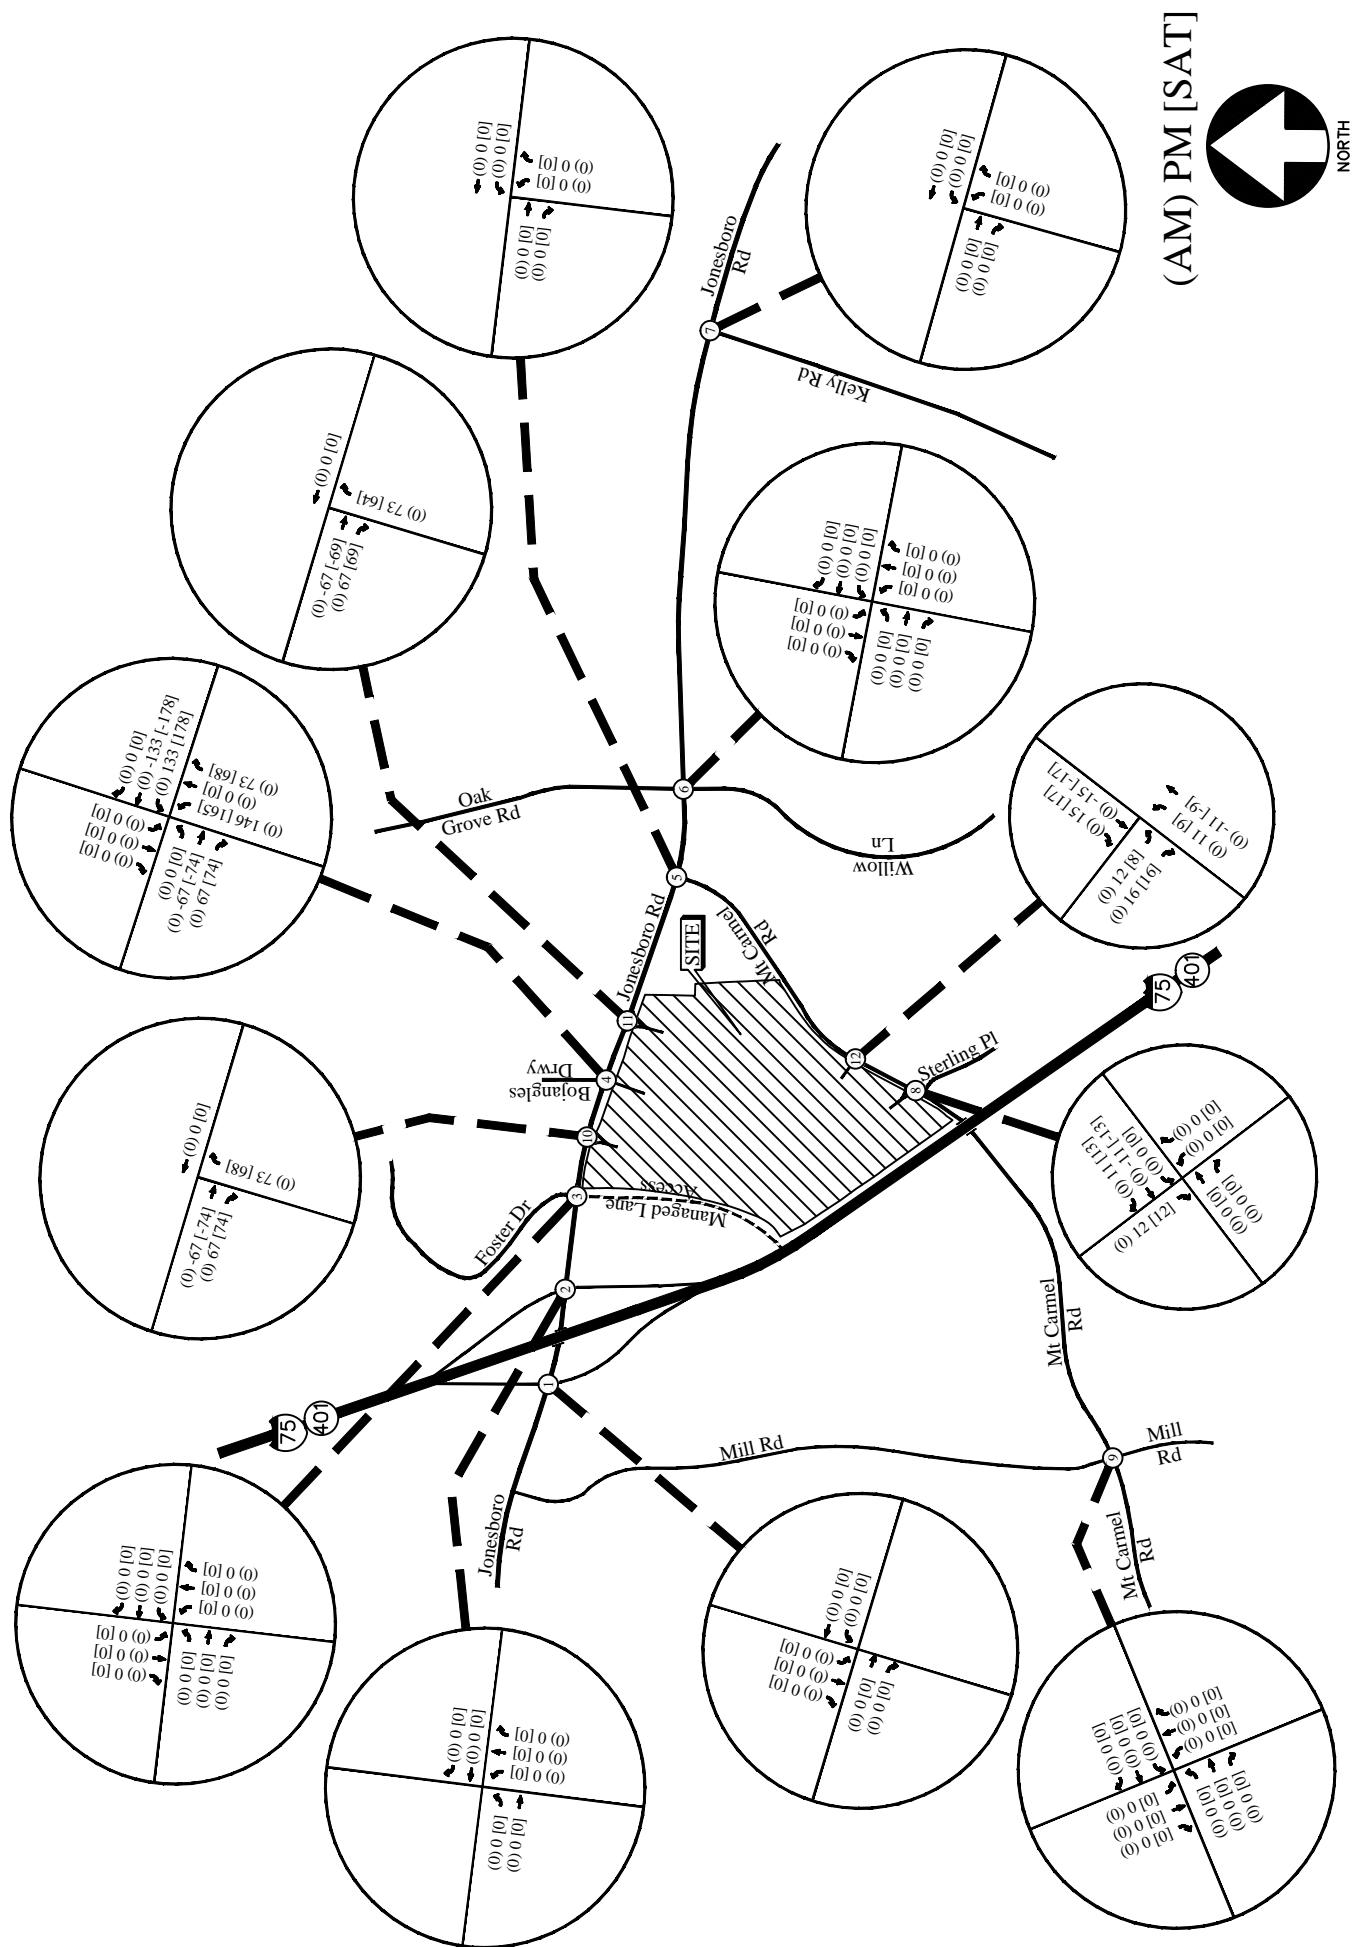

The trip distribution describes how traffic arrives and departs from the site. An overall trip distribution was developed for the site based on a review of the existing travel patterns in the area, and the locations of major roadways and highways that will serve the development. The site-generated peak hour traffic volumes, shown in Tables 5 and 6, were assigned to the study area intersections based on this distribution. The outer-leg distribution as well as the AM, PM, and Saturday peak hour new traffic generated by the site are shown in Figure 5. Pass-by volumes have also been distributed based on existing travel patterns and are shown in Figure 6.

(AM) PM [SAT]

OUTER LEG TRIP DISTRIBUTION AND SITE-GENERATED
PEAK HOUR VOLUMES

SITE PEAK HOUR PASS-BY VOLUMES

FIGURE 6

FUTURE TRAFFIC ANALYSIS

The future traffic operations are analyzed for the “Build” and “No-Build” conditions. This provides a basis of reference for determining both the contribution of the site to overall traffic conditions and the additional improvements needed to provide sufficient site access and capacity for passing traffic. Note that survey and construction drawings would be needed to verify the feasibility and extent of additional right-of-way required for any recommended improvements.

Improvements that are identified as “System Improvements” address deficiencies that are found within the existing road network prior to any impacts from the proposed development’s added traffic. Improvements that are identified as “Site Mitigation Improvements” address further impacts that are a result of the proposed development’s added traffic.

Future “No-Build” Conditions

The “No-Build” (or background) conditions provide an assessment of how traffic will operate in the study horizon year without the study site being developed as proposed, with projected increases in through traffic volumes due to normal annual growth. As GDOT Projects PI 0009156 and PI 0009157 will be completed before construction of the proposed development, projected shifts in traffic along the study network (calculated by GDOT) were included in the Future “No-Build” volumes as well. Moreover, to account for Mt. Carmel Road opening to all traffic with the completion of the GDOT projects, a total of 100 vehicles were added/subtracted to the existing detour route within the study network. The Future “No-Build” volumes consist of the existing traffic volumes (Figure 2) as well as increases for annual growth of through traffic and shifts in existing traffic due to the GDOT project and Mt. Carmel Road re-opening.

Annual Traffic Growth

In order to evaluate future traffic operations in this area, a projection of normal traffic growth was applied to the existing volumes. The Georgia Department of Transportation recorded average daily traffic volumes at several locations in the vicinity of the site. Reviewing the growth over the last several years revealed growth of approximately 1% in the area. This growth factor was applied to the existing traffic volumes between collector and arterial roadways in order to estimate the future year traffic volumes prior to the addition of site-generated traffic. The resulting Future “No-Build” volumes on the roadway are shown in Figure 7.

Planned and Programmed Improvements in Study Area

The following improvements have been identified in the Regional Transportation Plan (Plan 2040), GDOT TransPi, and/or the local comprehensive transportation plan. These improvements are within the vicinity of the proposed development.

TABLE 7 – PLANNED AND PROGRAMMED IMPROVEMENTS

ARC Number / GDOT Number / Local Number	Route	Type of Improvement	Scheduled Completion Year	Source
HE-920B / 342970 / NA	Jonesboro Rd Widening from US 19/41 (Tara Blvd) in Clayton County to I-75 South in Henry County	General Purpose Roadway Capacity	2030	Plan 2040 GDOT
AR-ML-640 / 0009156, 0009157 / NA	I-75 from Eagles Landing Pkwy to SR 155	Roadway/ Managed Lanes	Under Construction	GDOT
NA / 0007858 / NA	I-75 from I-675 to Jonesboro Rd	Widening	Long Range (LR2)	GDOT
NA / 0007891 / NA	I-75 from Bill Gardner Pkwy to Jonesboro Rd	Widening	Long Range	GDOT

Projects included in the model for the future conditions include:

GDOT Project PI #0009156, PI #0009157: Consists of a reversible, barrier-separated, managed lane system and Intelligent Transportation System infrastructure along I-75 in Henry and Clayton Counties. The managed lanes begin approximately 600 feet south of SR 138 (Stockbridge Highway) on I-75 and at SR 138 on I-675, and end at SR 155 on I-75, for a total length of 12.24 miles. From SR 155 to approximately 1 mile south of Mt. Carmel Road, the managed lane system will consist of one reversible lane transitioning to two reversible lanes.

Recommendations for System Improvements

Improvements that are identified as “System Improvements” address deficiencies that are found within the existing road network prior to any impacts from the proposed development’s added traffic and are taken under consideration by the local municipality. A summary of the system improvements is provided below with more detailed information on each intersection in the following narratives.

Jonesboro Road @ I-75 SB Ramps

The existing conditions analysis for the intersection of Jonesboro Road at I-75 SB Ramps indicates the southbound approach (I-75 Ramp) is currently operating at a level-of-service “E” in the Saturday peak hour before the addition of site traffic. It is recommended that the existing southbound shared through/left turn lane be restriped to accommodate through/left/right turn movements. This will allow more stacking for the southbound right turn movements.

Jonesboro Road @ I-75 NB Ramps

The queue for the westbound right turn movement is currently extending beyond the available storage in the AM peak hour. In order to accommodate the amount of stacking for the westbound right turn movement, it is recommended that the existing right turn lane be extended through to the next intersection.

Jonesboro Road@ Foster Drive/Managed Lanes Access

In order to accommodate the extended westbound right turn lane and right turn queue at the adjacent intersection of Jonesboro Road at I-75 NB Ramps, it is recommended that the existing dedicated westbound right turn lane be converted to operate as a shared through/right turn lane.

Jonesboro Road at Oak Grove Road/Willow Lane

The intersection of Jonesboro Road at Oak Grove Road/Willow Lane is currently operating at an acceptable level-of-service (“D” or better) during the AM, PM, and Saturday peak hours. After accounting for growth of background traffic, the intersection will begin to operate at a level-of-service “E” in the AM peak hour. In order to bring the level-of-service to the accepted threshold “D”, it is recommended that the southbound approach be shifted to the east in order to accommodate a dedicated right turn lane, and extend the northbound left turn lane storage to 500’ of full-width storage by restriping the existing gored area in the median. It is also recommended that protected + permissive signal phasing be installed for the northbound and southbound left turn movements.

Jonesboro Road at N. Bridges Road/Bojangle’s Driveway

The side-street approaches to the intersection of Jonesboro Road at N. Bridges Road/Bojangle’s Driveway are currently operating below an acceptable level-of-service (“E” or better). As this is an existing condition and the only improvement needed is for the southbound right movement, which is offsite and out of public right-of way, no reasonable improvements have been identified.

Mt. Carmel Road at Mill Road

One or more approaches to the intersection of Mt. Carmel Road at Mill Road will begin to operate below an acceptable level-of-service (“D” or better) after accounting for growth of background traffic. Due to

the intersection being all-way stop-controlled, and because queuing on each approach will not block other nearby intersections, no reasonable improvements have been identified at the intersection.

Summary of Recommended System Improvements

- Shift the southbound approach to the intersection of Jonesboro Road at Oak Grove Road/Willow Lane to the east in order to install a dedicated southbound right turn lane with 100' storage and a 75' taper and install protected + permissive signal phasing.
- Extend the northbound left turn lane at the above intersection to 500' of storage by restriping the existing gore area within the median and install protected + permissive signal phasing.
- It is recommended that the existing southbound through/left lane at the intersection of Jonesboro Road at I-75 SB Ramps be restriped to accommodate a through/left/right movement.
- It is recommended the existing westbound right turn lane at the intersection of Jonesboro Road at I-75 NB Ramps be extended through to the next intersection (Jonesboro Road at Foster Drive/Managed Lanes Access), replacing the existing dedicated westbound right turn lane at the Jonesboro Road at Foster Drive/Managed Lanes Access intersection with a shared through/right turn lane.

Future “No-Build” Traffic Operations

The future “No-Build” traffic operations were analyzed using the volumes in Figure 7 and the results are shown in Tables 8 and 9 below.

TABLE 8 — FUTURE “NO-BUILD” INTERSECTION OPERATIONS

Future “Build” Conditions

The “Build” or development conditions include the estimated background traffic from the “No-Build” conditions plus the added traffic from the proposed development. In order to evaluate future traffic operations in this area, the additional traffic volumes from the site (Figure 5) and pass-by volumes (Figure 6) were added to “No-Build” traffic volumes (Figure 7) to calculate the future traffic volumes after the construction of the development. These total future traffic volumes (Figure 8) were used to evaluate the “Build” condition. The results of the “Build” operations analyses with the assumed site access configuration are shown in Tables 10 and 11.

Site Access Configuration

The following access configuration was utilized when modeling the proposed site driveway intersections.

- Site Driveway #1: Full-access driveway on Jonesboro Road
 - This driveway will consist of two entering lanes and two exiting lanes.
 - The intersection will be controlled by an actuated traffic signal will a permissive + protected phase for the eastbound and westbound left turn movements.
 - Entering left turn movements will be made from a dedicated westbound left turn lane.
 - Entering right turn movements will be made from a dedicated eastbound deceleration lane.
- Site Driveway #2: Right-in/right-out driveway on Jonesboro Road
 - This driveway will consist of one entering and one exiting lane.
 - The intersection will be unsignalized with a YIELD sign on the northbound approach.
 - A deceleration lane will be constructed for entering traffic based on local standards.
- Site Driveway #3: Full-access driveway on Mt. Carmel Road
 - This driveway will consist of one entering lane and two exiting lanes. The southbound (driveway) approach will have a left turn and right turn lane for exiting traffic.
 - The intersection will be controlled by an actuated traffic signal.
 - Entering left turn movements will be made from a dedicated eastbound left turn lane.
 - Entering right turn movements will be made from a dedicated westbound deceleration lane.
- Site Driveway #4: Right-in/right-out driveway on Mt. Carmel Road
 - This driveway will consist of one entering lane and one exiting lane.
 - The intersection will be unsignalized with a YIELD sign on the southbound approach.
 - A westbound deceleration lane will be constructed for entering traffic based on local standards.
- Site Driveway #5: Right-in/right-out driveway on Jonesboro Road
 - This driveway will consist of one entering lane and one exiting lane.
 - The intersection will be unsignalized with a YIELD sign on the southbound approach.
 - An eastbound deceleration lane will be constructed for entering traffic based on local standards.

Recommendations for Site Mitigation Improvements

Improvements that are identified as mitigation improvements address deficiencies that are caused by site traffic and can be identified as related to the proposed development. A summary of the site mitigation improvements is provided below, with more detailed information on each intersection in the following narratives.

Jonesboro Road@ Foster Drive/Managed Lanes Access

Because a third eastbound through lane on Jonesboro Road is recommended beginning at this intersection, it is recommended dual rights on the northbound approach (Managed Lanes Access) be reconfigured to operate with one free-flow right turn and one yield-controlled right turn lane. A concept of this recommendation is included in the Appendix.

Jonesboro Road @ Mt. Carmel Road

Due to the large number of northbound right turns after the addition of site traffic, it is recommended that the existing northbound right turn operate with dual right turns and given permissive + overlap signal phasing.

Mt. Carmel Road at Mill Road

One or more approaches to the intersection of Mt. Carmel Road at Mill Road will continue to operate below an acceptable level-of-service ("D" or better) after accounting for site-generated traffic. Due to the intersection being all-way stop-controlled, and because queuing on each approach will not block other nearby intersections, no reasonable improvements have been identified at the intersection.

Jonesboro Road @ Site Driveway 1

The Future "Build" 2020 conditions analysis for Jonesboro Road at Site Driveway 1 indicates the intersection will operate at an overall level-of-service "F" during the PM and Saturday peak hours. It is recommended that dual left turn lanes be constructed for the westbound and northbound approaches and operate with protected signal phasing. To relieve congestion on the eastbound through movement, it is recommended a third through lane be constructed along the site frontage beginning at the intersection of Jonesboro Road at Foster Drive/Managed Lane Access through to drop as a right turn lane at the eastern right-in/right-out driveway (Site Driveway 5) on Jonesboro Road. Although this improvements will not bring the overall level-of-service to within the "D" threshold during the Saturday peak hour, the recommended improvements will reduce the overall delay at the intersection by more than 274 seconds/vehicle. As these delays will only be experienced during one peak hour out of the week, no further improvements are feasible at the intersection.

Summary of Recommended Site Mitigation Improvements

- Recommended system improvements (previous section) are also applicable as mitigation improvements.
- It is recommended a third through lane be constructed on Jonesboro Road along the site frontage beginning at the intersection of Jonesboro Road at Foster Drive/Managed Lanes Access

through to drop as a right turn lane at the eastern right-in/right-out driveway (Site Driveway 5) on Jonesboro Road.

- It is recommended the northbound dual rights at the intersection of Jonesboro Road at Foster Drive/Managed Lanes Access be reconfigured to operate with one free-flow right turn and one yield-controlled right turn.
- It is recommended northbound dual right turn lanes be added to the intersection of Jonesboro Road at Mt. Carmel Road and given permissive + overlap signal phasing.
- It is recommended westbound and northbound dual left turn lanes be constructed at the intersection of Jonesboro Road at Site Driveway 1 and given protected signal phasing.

Future “Build” Traffic Operations

The “Build” conditions are evaluated to determine effectiveness of the recommended system and site mitigation improvements. Recommendations on traffic control and lane geometry are shown graphically in Figure 9.

FUTURE TRAFFIC CONTROL AND LANE GEOMETRY

CONCLUSIONS AND RECOMMENDATIONS

Traffic impacts were evaluated for the added traffic from the proposed Henry Promenade mixed-use development that will be located to the east of I-75 between Jonesboro Road and Mt. Carmel Road in McDonough, Georgia. The development will consist of:

- Total Retail: 763,500 sf
- Hotel 1: 120 rooms
- Hotel 2: 100 rooms

The development proposes one full-access driveway as well as two right-in/right-out driveways on Jonesboro Road, and one full-access driveway as well as one right-in/right-out driveway on Mt. Carmel Road. Existing and future operations after completion of the project were analyzed at the intersections of:

- Jonesboro Road @ I-75 Southbound Ramps
- Jonesboro Road @ I-75 Northbound Ramps
- Jonesboro Road @ Foster Drive
- Jonesboro Road @ North Bridges Road/Bojangle's Driveway
- Jonesboro Road @ Mt. Carmel Road
- Jonesboro Road @ Oak Grove Road/Willow Lane
- Jonesboro Road @ Kelly Road
- Mt. Carmel Road @ North Bridges Road/Sterling Place
- Mt. Carmel Road @ Mill Road

The analysis included the evaluation of Future operations for “No-Build” and “Build” conditions, both of which account for increases in annual growth of through traffic and added traffic from other nearby planned developments. The results of the analysis are listed below:

System Recommendations and Improvements

Improvements that are identified as “System Improvements” address deficiencies that are found within the existing road network prior to any impacts from the proposed development’s added traffic and are taken under consideration by the local municipality. A summary of the system improvements is provided below with more detailed information on each intersection in the following narratives.

Jonesboro Road @ I-75 SB Ramps

The existing conditions analysis for the intersection of Jonesboro Road at I-75 SB Ramps indicates the southbound approach (I-75 Ramp) is currently operating at a level-of-service “E” in the Saturday peak hour before the addition of site traffic. It is recommended that the existing southbound shared through/left turn lane be restriped to accommodate through/left/right turn movements. This will allow more stacking for the southbound right turn movements.

Jonesboro Road @ I-75 NB Ramps

The queue for the westbound right turn movement is currently extending beyond the available storage in the AM peak hour. In order to accommodate the amount of stacking for the westbound right turn

movement, it is recommended that the existing right turn lane be extended through to the next intersection.

Jonesboro Road@ Foster Drive/Managed Lanes Access

In order to accommodate the extended westbound right turn lane and right turn queue at the adjacent intersection of Jonesboro Road at I-75 NB Ramps, it is recommended that the existing dedicated westbound right turn lane be converted to operate as a shared through/right turn lane.

Jonesboro Road at Oak Grove Road/Willow Lane

The intersection of Jonesboro Road at Oak Grove Road/Willow Lane is currently operating at an acceptable level-of-service ("D" or better) during the AM, PM, and Saturday peak hours. After accounting for growth of background traffic, the intersection will begin to operate at a level-of-service "E" in the AM peak hour. In order to bring the level-of-service to the accepted threshold "D", it is recommended that the southbound approach be shifted to the east in order to accommodate a dedicated right turn lane, and extend the northbound left turn lane storage to 500' of full-width storage by restriping the existing gored area in the median. It is also recommended that protected + permissive signal phasing be installed for the northbound and southbound left turn movements.

Jonesboro Road at N. Bridges Road/Bojangle's Driveway

The side-street approaches to the intersection of Jonesboro Road at N. Bridges Road/Bojangle's Driveway are currently operating below an acceptable level-of-service ("E" or better). As this is an existing condition and the only improvement needed is for the southbound right movement, which is offsite and out of public right-of way, no reasonable improvements have been identified.

Mt. Carmel Road at Mill Road

One or more approaches to the intersection of Mt. Carmel Road at Mill Road will begin to operate below an acceptable level-of-service ("D" or better) after accounting for growth of background traffic. Due to the intersection being all-way stop-controlled, and because queuing on each approach will not block other nearby intersections, no reasonable improvements have been identified at the intersection.

Summary of Recommended System Improvements

- Shift the southbound approach to the intersection of Jonesboro Road at Oak Grove Road/Willow Lane to the east in order to install a dedicated southbound right turn lane with 100' storage and a 75' taper and install protected + permissive signal phasing.
- Extend the northbound left turn lane at the above intersection to 500' of storage by restriping the existing gore area within the median and install protected + permissive signal phasing.
- It is recommended that the existing southbound through/left lane at the intersection of Jonesboro Road at I-75 SB Ramps be restriped to accommodate a through/left/right movement.
- It is recommended the existing westbound right turn lane at the intersection of Jonesboro Road at I-75 NB Ramps be extended through to the next intersection (Jonesboro Road at Foster Drive/Managed Lanes Access), replacing the existing dedicated westbound right turn lane at the Jonesboro Road at Foster Drive/Managed Lanes Access intersection with a shared through/right turn lane.

Site Access Configuration

The following access configuration was utilized when modeling the proposed site driveway intersections.

- Site Driveway #1: Full-access driveway on Jonesboro Road
 - This driveway will consist of two entering lanes and two exiting lanes.
 - The intersection will be controlled by an actuated traffic signal with a permissive + protected phase for the eastbound and westbound left turn movements.
 - Entering left turn movements will be made from a dedicated westbound left turn lane.
 - Entering right turn movements will be made from a dedicated eastbound deceleration lane.
- Site Driveway #2: Right-in/right-out driveway on Jonesboro Road
 - This driveway will consist of one entering and one exiting lane.
 - The intersection will be unsignalized with a YIELD sign on the northbound approach.
 - A deceleration lane will be constructed for entering traffic based on local standards.
- Site Driveway #3: Full-access driveway on Mt. Carmel Road
 - This driveway will consist of one entering lane and two exiting lanes. The southbound (driveway) approach will have a left turn and right turn lane for exiting traffic.
 - The intersection will be controlled by an actuated traffic signal.
 - Entering left turn movements will be made from a dedicated eastbound left turn lane.
 - Entering right turn movements will be made from a dedicated westbound deceleration lane.
- Site Driveway #4: Right-in/right-out driveway on Mt. Carmel Road
 - This driveway will consist of one entering lane and one exiting lane.
 - The intersection will be unsignalized with a YIELD sign on the southbound approach.
 - A westbound deceleration lane will be constructed for entering traffic based on local standards.
- Site Driveway #5: Right-in/right-out driveway on Jonesboro Road
 - This driveway will consist of one entering lane and one exiting lane.
 - The intersection will be unsignalized with a YIELD sign on the southbound approach.
 - An eastbound deceleration lane will be constructed for entering traffic based on local standards.

Site Mitigation Improvements

Improvements that are identified as mitigation improvements address deficiencies that are caused by site traffic and can be identified as related to the proposed development. A summary of the site mitigation improvements is provided below, with more detailed information on each intersection in the following narratives.

Jonesboro Road@ Foster Drive/Managed Lanes Access

Because a third eastbound through lane on Jonesboro Road is recommended beginning at this intersection, it is recommended dual rights on the northbound approach (Managed Lanes Access) be reconfigured to operate with one free-flow right turn and one yield-controlled right turn lane. A concept of this recommendation is included in the Appendix.

Jonesboro Road @ Mt. Carmel Road

Due to the large number of northbound right turns after the addition of site traffic, it is recommended that the existing northbound right turn operate with dual right turns and given permissive + overlap signal phasing.

Mt. Carmel Road at Mill Road

One or more approaches to the intersection of Mt. Carmel Road at Mill Road will continue to operate below an acceptable level-of-service ("D" or better) after accounting for site-generated traffic. Due to the intersection being all-way stop-controlled, and because queuing on each approach will not block other nearby intersections, no reasonable improvements have been identified at the intersection.

Jonesboro Road @ Site Driveway 1

The Future "Build" 2020 conditions analysis for Jonesboro Road at Site Driveway 1 indicates the intersection will operate at an overall level-of-service "F" during the PM and Saturday peak hours. It is recommended that dual left turn lanes be constructed for the westbound and northbound approaches and operate with protected signal phasing. To relieve congestion on the eastbound through movement, it is recommended a third through lane be constructed along the site frontage beginning at the intersection of Jonesboro Road at Foster Drive/Managed Lane Access through to drop as a right turn lane at the eastern right-in/right-out driveway (Site Driveway 5) on Jonesboro Road. Although this improvements will not bring the overall level-of-service to within the "D" threshold during the Saturday peak hour, the recommended improvements will reduce the overall delay at the intersection by more than 274 seconds/vehicle. As these delays will only be experienced during one peak hour out of the week, no further improvements are feasible at the intersection.

Summary of Recommended Site Mitigation Improvements

- Recommended system improvements (previous section) are also applicable as mitigation improvements.
- It is recommended a third through lane be constructed on Jonesboro Road along the site frontage beginning at the intersection of Jonesboro Road at Foster Drive/Managed Lanes Access through to drop as a right turn lane at the eastern right-in/right-out driveway (Site Driveway 5) on Jonesboro Road.
- It is recommended the northbound dual rights at the intersection of Jonesboro Road at Foster Drive/Managed Lanes Access be reconfigured to operate with one free-flow right turn and one yield-controlled right turn.
- It is recommended northbound dual right turn lanes be added to the intersection of Jonesboro Road at Mt. Carmel Road and given permissive + overlap signal phasing.
- It is recommended westbound and northbound dual left turn lanes be constructed at the intersection of Jonesboro Road at Site Driveway 1 and given protected signal phasing.

GRTA Letter of Understanding

LETTER OF UNDERSTANDING

November 24, 2015

Steve Edwards
Stafford Properties
295 West Crossville Road
Suite 400
Roswell, Georgia 30075

RE: DRI 2527 Henry Promenade

Dear Mr. Edwards:

The purpose of this letter is to document the discussions during the Pre-Review and Methodology Meeting held at ARC's office on November 16, 2015 regarding **DRI 2527 Henry Promenade**. Some of the following items were discussed in this meeting and should assist you and your consultant team in preparing the DRI Review Package.

PROJECT OVERVIEW

- The project is located in Henry County. The proposed development is located on the southern side of Jonesboro Road/SR 920 and east of I-75 with proposed access onto Jonesboro Road and Mount Carmel Road.
- The DRI trigger for this development is a rezoning.
- The proposed development is consisting of approximately 763,500 square feet of commercial retail/shopping center and two hotels totaling 220 rooms.
- The estimated vehicular trip generation is 27,050 gross daily trips based on the *ITE Trip Generation Manual, 9th Edition, 2012*.
- The projected build out for this DRI is 2020 in one phase.
- The applicant is applying for approval under GRTA's non-expedited review process.

METHODOLOGY

- All intersections identified as within the study network shall be analyzed during the AM and PM peak hours for (1) existing conditions, (2) future "no-build" conditions [may not be applicable for the site driveways], and (3) future "build" conditions. This DRI shall be reviewed in one phase to be completed by 2020.
- Capacity analysis shall be based on turning movement counts collected not more than 12-months prior to the date of the actual DRI submittal to GRTA. As appropriate, pedestrian counts and heavy vehicle counts shall be collected with vehicle counts and considered within the capacity analysis. Turning movement counts shall be collected while local schools are in session and ordinarily not between the week of Thanksgiving and the second week of January or any week of a major holiday.
- A 1.0% background traffic growth rate shall be used for all roadways.
- The level of service standard for all analyses shall be LOS D.

- Mixed use and pass-by trip reductions are allowed with no alternative mode reductions.
- Default values should not be assumed in the traffic modeling. Existing conditions shall be taken into account.
- The applicant shall research TIP, STIP, RTP, and GDOT's construction work program, as well as any local government plans (SPLOST, CIP, etc.), to determine the open-to-traffic date, sponsor, cost of the project, funding source(s), for future roadway projects in the project vicinity. This information shall be included within the traffic analysis.

STUDY NETWORK

1. Jonesboro Road (SR920) at I-75 Southbound Ramps
2. Jonesboro Road (SR920) at I-75 Northbound Ramps
3. Jonesboro Road (SR920) at Foster Road/I-75 Managed Lane Access Ramp
4. Jonesboro Road (SR920) at Mount Carmel Road
5. Jonesboro Road (SR920) at Oak Grove Road/Willow Lane
6. Jonesboro Road (SR920) at Kelly Road
7. Mount Carmel Road at Mill Road
8. All site driveways

ADDITIONAL INFORMATION

Every roadway segment and intersection listed above will be analyzed for "required improvements." If the existing LOS for the segment or intersection is below the applicable level of service for a particular time period (e.g., A.M. peak period, P.M. peak period, etc.), then the measured LOS service for that segment and time periods is the standard by which the "base" and "future" traffic conditions will be designed. For example, if the County's LOS standard is LOS D, but an intersection or segment currently operates at LOS E for a certain peak period, then the LOS standard for that intersection or segment for "base" and "future" conditions becomes LOS E (only for that intersection and only for that peak period). The "base" is the phase year traffic without the development traffic (also called future "no-build" conditions) and the "future" is the phase year with the development traffic (also called future "build" conditions). As required in the technical guidelines, specific "required improvements" will be identified to bring the "base" LOS and "future" LOS for every roadway segment and intersection up to the applicable LOS standard. If the existing LOS for the segment or intersection is LOS F, then the future "no-build" and future "build" LOS standard will be LOS E. The improvements required to achieve the desired LOS standard will be provided in a table and graphic within the study. The traffic study should indicate the existing roadway laneage at each studied intersection as well as the laneage required (to meet the LOS standard) for future "no-build" and future "build" conditions. The improvements may include both programmed improvements and improvements identified in the study.

The planned and programmed improvement should indicate the project sponsor, the anticipated funding by source (federal, state, city/county, developer, CID, etc.), the year open-to-traffic, and estimate of the total project cost. All other required improvements identified in the study should, to the extent known, identify the cost, sponsor, funding, and timing. If any of these elements are not known, please state as "unknown."

The future "no-build" and the future "build" analyses should NOT automatically include/assume the additional lanes/capacity associated with planned and programmed improvement projects unless those roadway projects are currently under construction. Instead, the traffic consultant should recommend the additional laneage required to satisfy the level of service standard.

DRI REVIEW PACKAGE CHECKLIST

Please use the DRI Review Package Checklist to help you prepare your GRTA DRI Review Package for expedited review of your application. The Checklist reflects the understandings set forth in this letter, and is incorporated into this letter by reference.

The site plan shall be prepared in accordance with Section 4-104 of the DRI Review Package Technical Guidelines and it shall be dated, and shall be at a scale of 1"= 200' or larger (showing more detail). The site plan shall be consistent with GRTA's Site Plan Information Guidelines, which represents the minimum required information on site plans.

The applicant shall indicate on the site plans all adjacent land uses, current zoning, and future land use as indicated on the future land use map. Additionally, all existing and proposed sidewalks, existing and proposed pedestrian trails, and existing and proposed roadway laneage should be indicated on the site plan.

DRI REVIEW PACKAGE SUBMITTAL

At the time you are ready to submit your DRI Review Package to GRTA, please note the following:

- Provide one (1) paper copy of all materials:
 - Transportation analysis
 - Site Plan
- Provide one (1) CD-ROM with electronic versions of all submittal documents:
 - Provide a PDF of each document
 - Provide the native format for each document
 - .dwg is the preferred CAD format (AutoCAD)
 - .doc is the preferred word processing format (Word)
 - .xls is the preferred spreadsheet format (Excel)
 - .sy6 or .sy7 is the preferred capacity analysis format (Synchro)

As part of the completeness certification process, please have your consultant forward one copy of the completed GRTA DRI Review Package (traffic analysis, site plan, CD) to the GDOT District Office, Regional Commission and local government Planning & Development and Transportation group (contact information provided below). GRTA shall be copied on each of the transmittal letters.

ATLANTA REGIONAL COMMISSION	GDOT DISTRICT 3	HENRY COUNTY PLANNING AND ZONING	HENRY COUNTY TRANSPORTATION

Planned Thru Lane

4

Network Year

2030

Corridor Length

7.4 miles

Detailed Description and Justification

The project consists of widening and reconstructing Jonesboro Road from US 19/41 to I-75. The project will widen the existing two-lane roadway to a four-lane facility with a 20' raised median with 12' outside shoulders. The Metro Arterial Connector (MAC) is a network of state highways approximately 180 miles in length encircling the Atlanta region. Roadways comprising the MAC (primarily SR 20 and SR 92) are proposed to have a minimum of four travel lanes along its entire length. At least 30 capacity projects are already planned along the MAC over the timeframe of the RTP. A study will be conducted in 2009 to determine how these individual projects can be engineered and constructed in a holistic and logical manner to maximize the mobility, safety, accessibility and growth management benefits which would best serve multimodal needs (auto, truck, transit, bicycling, walking) and include land use policies, access management regulations, and ITS components to ensure network uniformity.

PROJ ID	COUNTY	DESCRIPTION																														
342970-	Henry	JONESBORO RD FM W OF SR 3/US 41/CLAYTON TO I-75/HENRY																														
Mgmt Let Date:	9/15/2018	The proposed Project STP-1583(12), Clayton and Henry Counties would provide for the widening and reconstruction of Jonesboro Road from the intersection of US 19/US 41/Tara Boulevard to Mill Road (west of Interstate 75), for a length of approximately 7.5 miles. The proposed project would widen the existing two-lane roadway to four lanes with a raised median and curb and gutter on the outside. The proposed typical section would consist of two, 12-foot lanes in each direction divided by a 20-foot raised median with 4-foot bike lanes and 12-foot shoulders. The proposed right-of-way would vary from 92 feet to 150 feet.

Intersection Summary

Cycle Length: 140

Actuated Cycle Length: 140

Offset: 93 (66%), Referenced to phase 2:EBTL and 6:WBTL, Start of Green

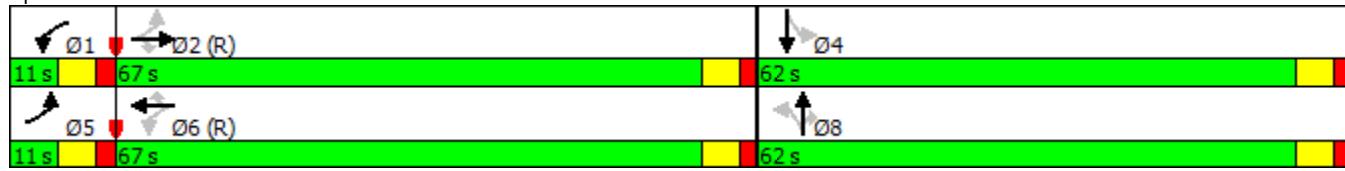

Natural Cycle: 95

Control Type: Actuated-Coordinated

95th percentile volume exceeds capacity, queue may be longer.

Queue shown is maximum after two cycles.

Splits and Phases: 6: Willow Lane/Oak Grove Rd & Jonesboro Rd

Intersection Summary

Cycle Length: 150

Actuated Cycle Length: 150

Offset: 82 (55%), Referenced to phase 2:EBTL and 6:WBTL, Start of Green

Natural Cycle: 95

Control Type: Actuated-Coordinated

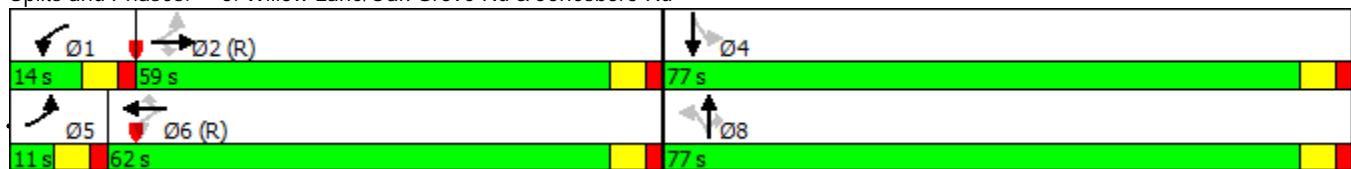

~ Volume exceeds capacity, queue is theoretically infinite.

Queue shown is maximum after two cycles.

95th percentile volume exceeds capacity, queue may be longer.

Queue shown is maximum after two cycles.

Splits and Phases: 6: Willow Lane/Oak Grove Rd & Jonesboro Rd

Intersection Summary

Cycle Length: 150

Actuated Cycle Length: 150

Offset: 141 (94%), Referenced to phase 2:EBT and 6:WBTL, Start of Green

Natural Cycle: 90

Control Type: Actuated-Coordinated

95th percentile volume exceeds capacity, queue may be longer.

Queue shown is maximum after two cycles.

m Volume for 95th percentile queue is metered by upstream signal.

Splits and Phases: 1: I-75 SB Ramps & Jonesboro Rd

Intersection Summary

Cycle Length: 150

Actuated Cycle Length: 150

Offset: 84 (56%), Referenced to phase 2:EBTL and 6:WBTL, Start of Green

Natural Cycle: 95

Control Type: Actuated-Coordinated

~ Volume exceeds capacity, queue is theoretically infinite.

Queue shown is maximum after two cycles.

95th percentile volume exceeds capacity, queue may be longer.

Queue shown is maximum after two cycles.

Splits and Phases: 6: Willow Lane/Oak Grove Rd & Jonesboro Rd

GDOT Left Turn Lane Analysis

LEFT TURN LANE ANALYSIS

per GDOT standards

The following left turn lane analyses were used to determine the need for dedicated turn bays at the proposed site driveway locations that are located on State Routes.

GDOT standards require the installation of a left lane on state routes at no cost to the department when traffic entering the development meets or exceeds the values shown in the following table.

GDOT REQUIREMENTS FOR LEFT TURN LANES					
Site Driveway	Left Turn Traffic (% Total Entering)	Left Turn Volume (veh/day)	Roadway Speed / # Lanes	GDOT Threshold (veh/day)	Requirement
Jonesboro Road @ Site Drwy 1	31%	4,193	45 mph / 4-Lane	250	235' storage 100' taper
Mt. Carmel Road @ Site Drwy 3	7%	947	45 mph / 2-Lane	250	235' storage 100' taper

Findings

Based on the number of projected daily left turns into the proposed development, Site Driveway 1 and Site Driveway 3 will meet the GDOT requirements for construction of a left turn lane.

GDOT Right Turn Lane Analysis

RIGHT TURN LANE ANALYSIS per GDOT standards

The following right turn lane analyses were used to determine the need for dedicated turn bays at the proposed site driveway locations that are located on State Routes.

GDOT standards require the installation of a deceleration lane on state routes at no cost to the department when traffic entering the development meets or exceeds the values shown in the following table.

GDOT REQUIREMENTS FOR DECELERATION LANES					
Site Driveway	Right Turn Traffic (% Total Entering)	Right Turn Volume (veh/day)	Roadway Speed / # Lanes	GDOT Threshold (veh/day)	Requirement
Jonesboro Road @ Site Drwy 1	31%	4,193	45 mph / 4-Lane	75	175' storage 100' taper
Jonesboro Road @ RIRO Drwy 1	18%	2,435	45 mph / 4-Lane	75	175' storage 100' taper
Jonesboro Road @ RIRO Drwy 2	12%	1,623	45 mph / 4-Lane	75	175' storage 100' taper
Mt. Carmel Road @ Site Drwy 3	5%	676	45 mph / 2-Lane	150	175' storage 100' taper
Mt. Carmel Road @ RIRO Drwy 3	2%	271	45 mph / 2-Lane	150	175' storage 100' taper

Findings

Based on the number of projected daily right turns, all of the site driveways will meet the GDOT requirements for construction of deceleration lane.

Intersection Summary

Cycle Length: 150

Actuated Cycle Length: 150

Offset: 0 (0%), Referenced to phase 2:EBTL and 6:WBT, Start of Green

Natural Cycle: 145

Control Type: Actuated-Coordinated

~ Volume exceeds capacity, queue is theoretically infinite.

Queue shown is maximum after two cycles.

95th percentile volume exceeds capacity, queue may be longer.

Queue shown is maximum after two cycles.

Splits and Phases: 3: Managed Lane Ramp/Foster Dr & Jonesboro Rd

Intersection Summary

Cycle Length: 150

Actuated Cycle Length: 150

Offset: 89 (59%), Referenced to phase 2:EBTL and 6:WBTL, Start of Green

Natural Cycle: 135

Control Type: Actuated-Coordinated

~ Volume exceeds capacity, queue is theoretically infinite.

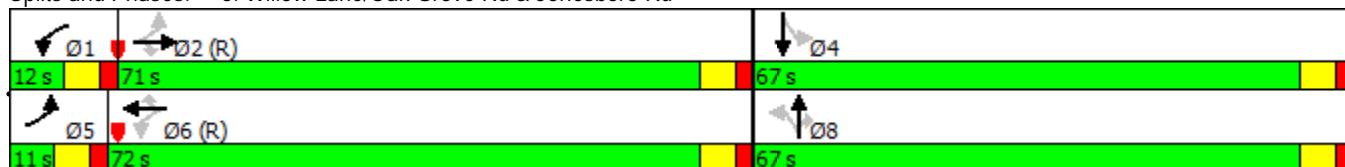

Queue shown is maximum after two cycles.

95th percentile volume exceeds capacity, queue may be longer.

Queue shown is maximum after two cycles.

m Volume for 95th percentile queue is metered by upstream signal.

Intersection Summary

Cycle Length: 150

Actuated Cycle Length: 150

Offset: 4 (3%), Referenced to phase 2:EBTL and 6:WBT, Start of Green

Natural Cycle: 90

Control Type: Actuated-Coordinated

95th percentile volume exceeds capacity, queue may be longer.

Queue shown is maximum after two cycles.

m Volume for 95th percentile queue is metered by upstream signal.

Splits and Phases: 2: I-75 NB Ramps & Jonesboro Rd

Intersection Summary

Cycle Length: 150

Actuated Cycle Length: 150

Offset: 90 (60%), Referenced to phase 2:EBTL and 6:WBTL, Start of Green

Natural Cycle: 135

Control Type: Actuated-Coordinated

~ Volume exceeds capacity, queue is theoretically infinite.

Queue shown is maximum after two cycles.

95th percentile volume exceeds capacity, queue may be longer.

Queue shown is maximum after two cycles.

m Volume for 95th percentile queue is metered by upstream signal.

Intersection Summary

Cycle Length: 150

Actuated Cycle Length: 150

Offset: 128 (85%), Referenced to phase 2:EBTL and 6:WBTL, Start of Green

Natural Cycle: 150

Control Type: Actuated-Coordinated

~ Volume exceeds capacity, queue is theoretically infinite.

Queue shown is maximum after two cycles.

95th percentile volume exceeds capacity, queue may be longer.

Queue shown is maximum after two cycles.

m Volume for 95th percentile queue is metered by upstream signal.

Splits and Phases: 4: Site Drwy 1 & Jonesboro Rd

Intersection Summary

Cycle Length: 150

Actuated Cycle Length: 150

Offset: 33 (22%), Referenced to phase 2:EBTL and 6:WBTL, Start of Green

Natural Cycle: 145

Control Type: Actuated-Coordinated

~ Volume exceeds capacity, queue is theoretically infinite.

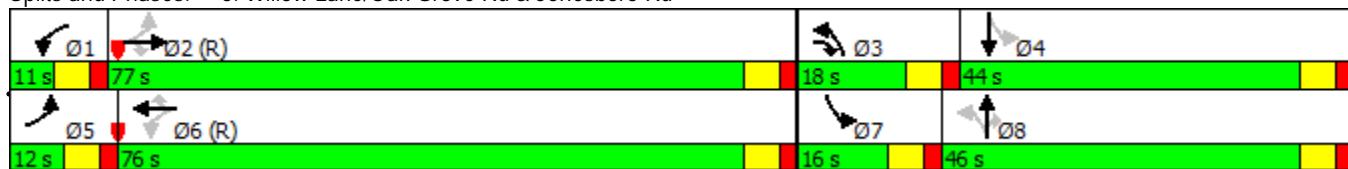

Queue shown is maximum after two cycles.

95th percentile volume exceeds capacity, queue may be longer.

Queue shown is maximum after two cycles.

m Volume for 95th percentile queue is metered by upstream signal.

Intersection Summary

Cycle Length: 150

Actuated Cycle Length: 150

Offset: 143 (95%), Referenced to phase 2:EBTL and 6:WBT, Start of Green

Natural Cycle: 135

Control Type: Actuated-Coordinated

~ Volume exceeds capacity, queue is theoretically infinite.

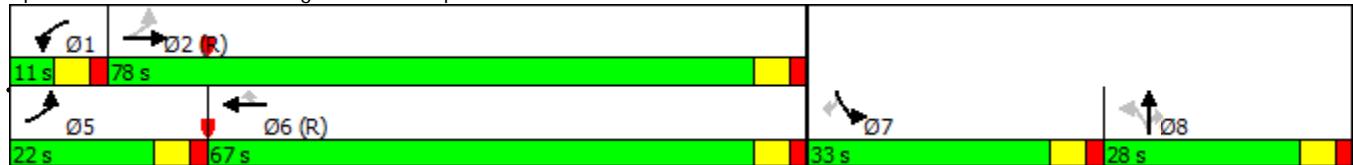

Queue shown is maximum after two cycles.

95th percentile volume exceeds capacity, queue may be longer.

Queue shown is maximum after two cycles.

m Volume for 95th percentile queue is metered by upstream signal.

Intersection Summary

Cycle Length: 150

Actuated Cycle Length: 150

Offset: 24 (16%), Referenced to phase 2:EBTL and 6:WBTL, Start of Green

Natural Cycle: 135

Control Type: Actuated-Coordinated

~ Volume exceeds capacity, queue is theoretically infinite.

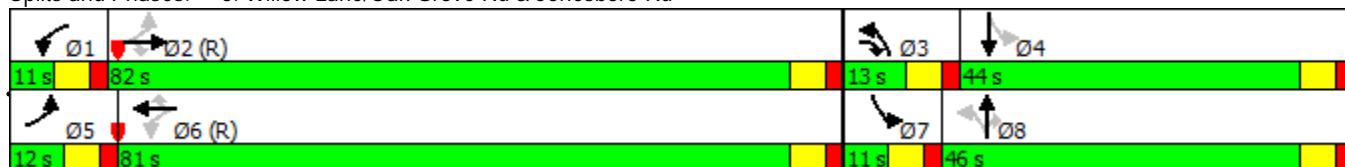

Queue shown is maximum after two cycles.

95th percentile volume exceeds capacity, queue may be longer.

Queue shown is maximum after two cycles.

m Volume for 95th percentile queue is metered by upstream signal.

Splits and Phases: 6: Willow Lane/Oak Grove Rd & Jonesboro Rd

Intersection Summary

Cycle Length: 140

Actuated Cycle Length: 140

Offset: 129 (92%), Referenced to phase 2:EBTL and 6:WBT, Start of Green

Natural Cycle: 140

Control Type: Actuated-Coordinated

~ Volume exceeds capacity, queue is theoretically infinite.

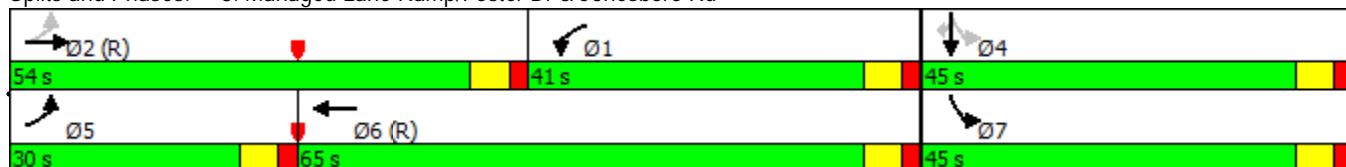

Queue shown is maximum after two cycles.

95th percentile volume exceeds capacity, queue may be longer.

Queue shown is maximum after two cycles.

m Volume for 95th percentile queue is metered by upstream signal.

Intersection Summary

Cycle Length: 140

Actuated Cycle Length: 140

Offset: 24 (17%), Referenced to phase 2:EBTL and 6:WBTL, Start of Green

Natural Cycle: 135

Control Type: Actuated-Coordinated

~ Volume exceeds capacity, queue is theoretically infinite.

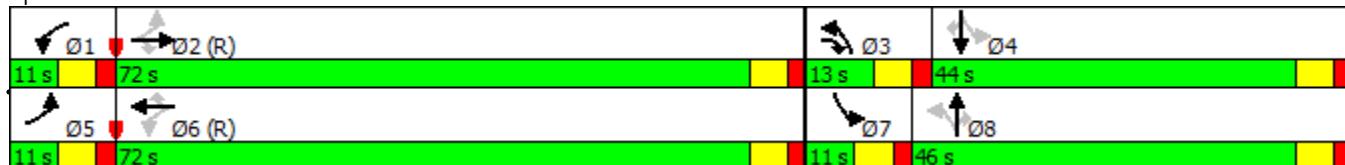

Queue shown is maximum after two cycles.

95th percentile volume exceeds capacity, queue may be longer.

Queue shown is maximum after two cycles.

m Volume for 95th percentile queue is metered by upstream signal.

Splits and Phases: 6: Willow Lane/Oak Grove Rd & Jonesboro Rd

HCM Signalized Intersection Capacity Analysis

Intersection Summary

Cycle Length: 150

Actuated Cycle Length: 150

Offset: 42 (28%), Referenced to phase 2:EBT and 6:WBTL, Start of Green

Natural Cycle: 120

Control Type: Actuated-Coordinated

~ Volume exceeds capacity, queue is theoretically infinite.

Queue shown is maximum after two cycles.

95th percentile volume exceeds capacity, queue may be longer.

Queue shown is maximum after two cycles.

m Volume for 95th percentile queue is metered by upstream signal.

Intersection Summary

Cycle Length: 150

Actuated Cycle Length: 150

Offset: 11 (7%), Referenced to phase 2:EBTU and 6:WBTL, Start of Green

Natural Cycle: 140

Control Type: Actuated-Coordinated

~ Volume exceeds capacity, queue is theoretically infinite.

Queue shown is maximum after two cycles.

95th percentile volume exceeds capacity, queue may be longer.

Queue shown is maximum after two cycles.

m Volume for 95th percentile queue is metered by upstream signal.
