1 Project Description

This Development of Regional Impact (DRI) study was conducted to assess the impact of the proposed development of Vantage Date Center on the surrounding transportation network. The project site is located on Roberts Road in the city of Douglasville in Douglasville County, GA. The ±95.12-acre site is currently undeveloped. The proposed project consists of three three-story data center buildings totaling an area of 1,657,000 square feet. The anticipated buildout year for this project is 2025. A site location map is shown in **Figure 1**, and an aerial map is shown in **Figure 2**.

Access to the site is proposed via three (3) full access driveways on Roberts Road. An exit-only access driveway on Riverside Parkway will be dedicated for emergency purposes. A preliminary site plan is included in **Appendix A**. Data used in the analysis consisted of the preliminary site plan provided by the project engineers, peak hour traffic counts collected by NV5, and Georgia Department of Transportation (GDOT) web-based applications and published information.

Figure 1: Site Location Map

Figure 2: Aerial View of the Site Location

1.1 Zoning and Land Use

The trigger for this DRI process is rezoning. This site is currently zoned for PUD (Planned Unit Development), surrounded by PUD districts. Future land use description for the subject site is MUD (Mixed-Use Design). The site will be rezoned for Light Industrial.

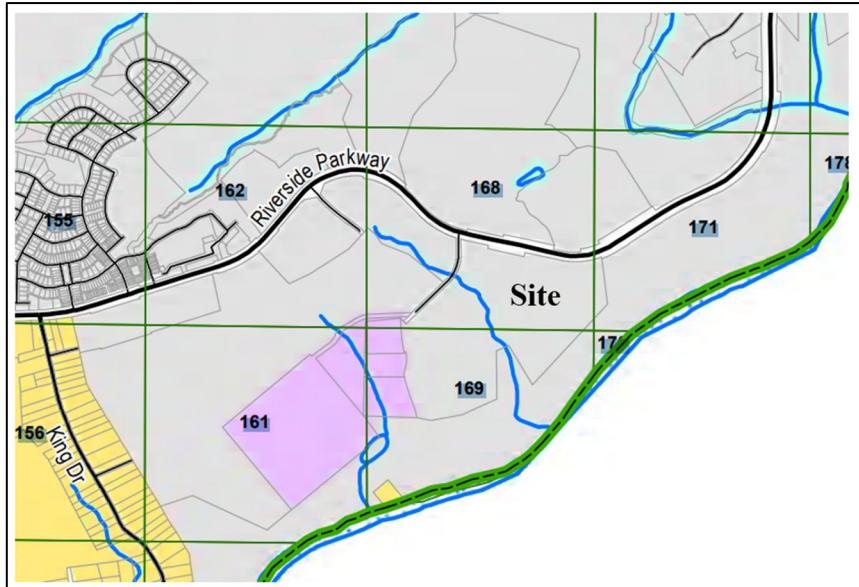

Figure 3: Zoning Map

2 Study Area

The study area for the proposed development was determined based on the nearest significant intersections from the site access driveways. Accordingly, the analysis considered the project's impact on the following intersections:

- Fairburn Road (SR 92) at Riverside Parkway (an existing three-leg signalized intersection)
- Riverside Parkway at Roberts Road (an existing three-leg stop-controlled intersection)
- Riverside Parkway at Thornton Road (SR 6) (an existing four-leg signalized intersection)
- Roberts Road at Site Driveway A (a proposed full access driveway)
- Roberts Road at Site Driveway B (a proposed full access driveway)
- Roberts Road at Site Driveway C (a proposed full access driveway)

3 Existing Conditions

3.1 Adjacent Roadway Facilities

Fairburn Road (SR 92) is a four-lane divided roadway and runs primarily south-north in the vicinity of the project site. The roadway is functionally classified by GDOT as an urban principal arterial-other and has a posted speed limit of 45 mph. Sidewalks are not provided along both sides of the roadway.

Riverside Parkway is a two-lane undivided roadway and runs primarily west-east in the study area. The roadway is functionally classified by GDOT as an urban minor arterial and has a posted speed limit of 45 mph. Sidewalks are not provided along both sides of the roadway. There are dedicated bike lanes on both sides of the road.

Vantage Date Center – DRI Report
Douglasville County, GA

Roberts Road is a two-lane undivided, unpaved roadway and runs primarily south-north in the study area. The roadway is functionally classified by GDOT as an urban local road and does not have a posted speed limit. Roberts Road is a dead-end road that terminates north of the project site. Sidewalks are not provided along both sides of the roadway. For analysis purposes, a speed limit of 25 mph was assumed.

Thornton Road (SR 6) is a four-lane divided roadway and runs primarily south-north in the vicinity of the project site. The roadway is functionally classified by GDOT as an urban principal arterial-other and has a posted speed limit of 55 mph. Sidewalks are not provided along both sides of the roadway.

3.2 Existing Lane Geometry and Traffic Control

The existing lane geometry and traffic control for the study intersections are shown in **Figure 4**.

Figure 5: Existing (2023) Traffic Volumes

3.3 Traffic Data

Turning movement counts were collected while public schools were in session on Tuesday, May 23, 2023. The AM peak hour was determined to be 7:15 AM-8:15 AM and the PM peak hour to be 5:00 PM-6:00 PM. The peak hour turning movement volumes are shown graphically in **Error! Reference source not found.**5. Additional 24-hour bi-directional vehicle volume counts were collected along the site frontage Riverside Parkway. The raw traffic counts are included in **Appendix B**. The existing (2023) AM and PM peak hour vehicular turning movement volumes are displayed in **Figure 5**.

3.4 Nearby Developments and Proposed Projects

According to ARC's Transportation Improvement Program, Douglas County's Transit Master Plan, Douglas County SPLOST Program 2016-2023, and GDOT's Construction Work Program, the projects in Table 1 are programmed or planned to be completed.

Table 1: Projects in the Study Network

Roadway	PI #	Project Description

Chattahoochee Hills Greenway Trail	12877	11-mile multi-use trail from Boundary Waters Park to Old Factory Shoals Road/ Factory Shoals Road intersection

3.5 Existing Capacity Analysis

A capacity analysis for the study intersections was performed under existing (2023) conditions based on the Highway Capacity Manual 6th Edition (HCM 6), whenever applicable, during the AM and PM peak hours using Synchro 11. Existing conditions represent existing intersection geometrical layouts, existing traffic control, and existing (2023) vehicular turning movement counts during the AM and PM peak hours. Capacity analysis results, including vehicular control delay, level of service (LOS) at the movement and intersection levels, and 95th percentile queue lengths, are summarized in **Table 1**. Average vehicular delays are shown in seconds per vehicle. LOS is a grading system as defined by the HCM where A is the best, and F is the worst. Fully optimized signal timing plans were considered for analysis of signalized intersections. Detailed capacity and queue analysis reports under existing (2023) conditions can be found in **Appendix C**.

Table 2: Existing Conditions Capacity Analysis

ID	Intersection	Traffic Control	Movement	AM Peak Hour			PM Peak Hour

The worst movement delay was reported for uncontrolled approaches at unsignalized intersections

As indicated in **Table 2**, the existing (2023) capacity analysis revealed the following results:

Fairburn Road (SR 92) at Riverside Parkway

- During the AM and PM peak hours, all turning movements currently operate at LOS C or better except for the WB left turn movement which operates at **LOS F**.
- The intersection operates sufficiently at LOS B during both peak hours.

Riverside Parkway at Roberts Road

- During the AM and PM peak hours, all turning movements currently operate at LOS C or better.
- The intersection operates adequately with negligible delay during both peak hours.

Riverside Parkway at Thornton Road

- During the AM peak hour, the eastbound through, westbound left, and southbound left turn movements currently operate inadequately at **LOS F**. Additionally westbound through, northbound left and southbound through movements operate at LOS E.

- During the PM peak hour, the southbound left turn and westbound through movements currently operate inadequately at LOS F. Additionally, westbound left, northbound left, and southbound through movements operate at LOS E
- The remaining turn movements currently operate at LOS D or better during both peak hours.
- The intersection still operates sufficiently at an overall LOS D during both peak hours.

4 Background Conditions

4.1 Background Lane Geometry and Traffic Control

Lane geometry and traffic control under background (2025) conditions are depicted in **Figure 6**.

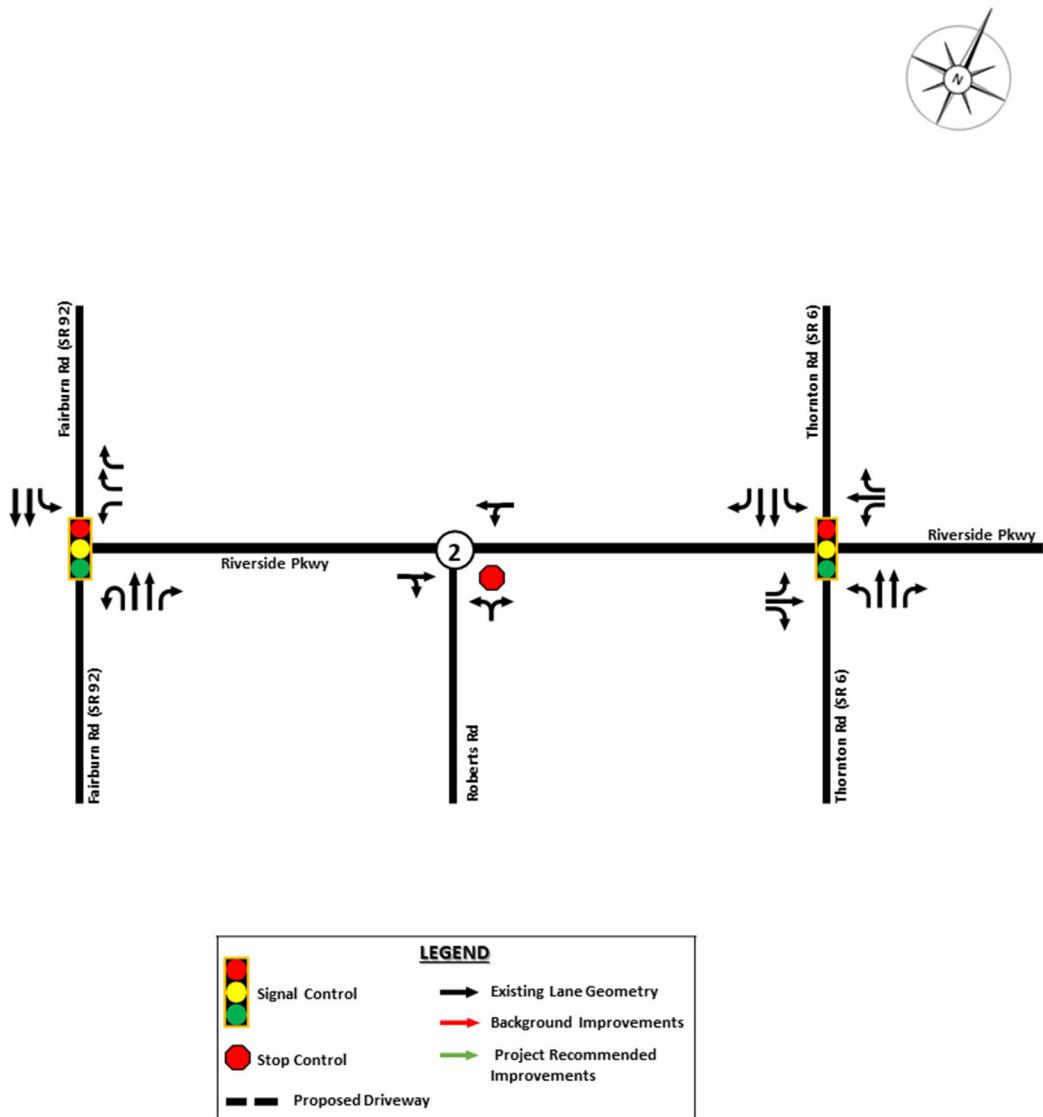

Figure 6: Background (2025) Lane Geometry and Traffic Control

4.2 Background Traffic

Background traffic growth is the analysis method of analyzing historic trends in traffic volumes / population growth, and future growth projections to determine an annual growth rate which is applied to the existing traffic counts on the study network. The background traffic growth in the study area was based on the calculated growth rate of 2.2% that was applied to the existing turning movement counts. Background traffic volumes were computed by applying the calculated growth rate to the existing (2023) turning movement volumes. Background (2025) AM and PM peak hour vehicular turning movement volumes are displayed in **Figure 7**.

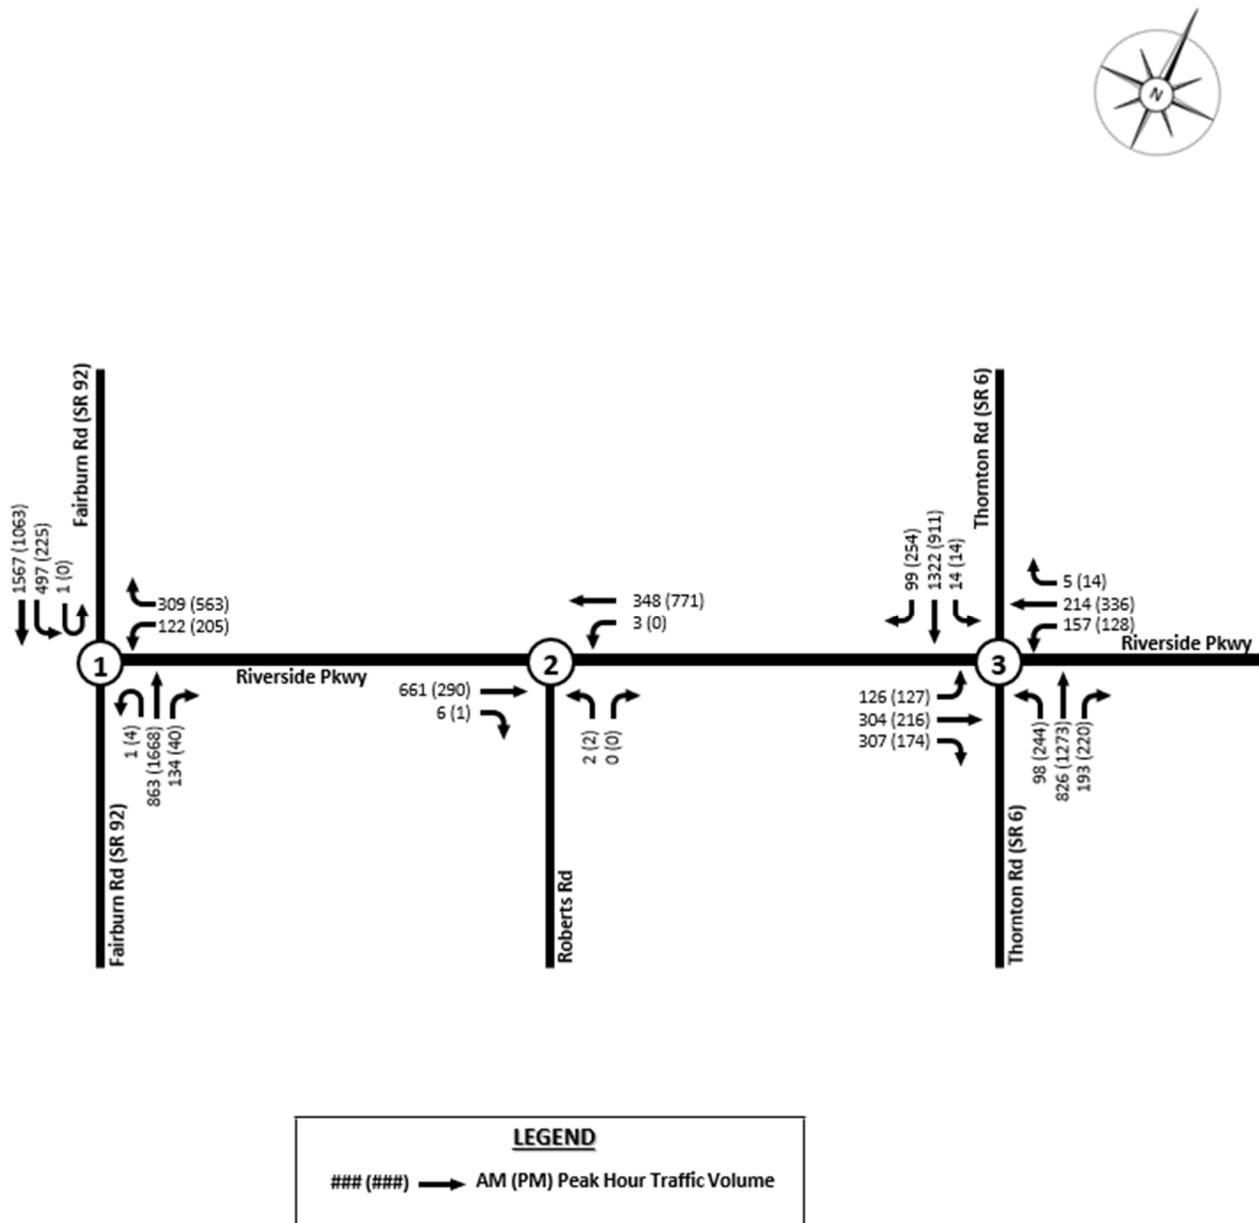

Figure 7: Background (2025) Traffic Volumes

4.3 Background Capacity Analysis

A capacity analysis for the study intersections was performed under background (2025) conditions based on the HCM 6's methodology, whenever applicable, during the AM and PM peak hours using Synchro 11. Background conditions represent future intersection geometrical layouts, future traffic control, and projected (2025) vehicular turning movement counts during the AM and PM peak hours. Capacity analysis results, including vehicular control delay, LOS at the approach and intersection levels, and 95th percentile queue lengths, are summarized in **Table 3**. Average vehicular delays are shown in seconds per vehicle. LOS is a grading system defined by the HCM where A is the best, and F is worst. Fully optimized signal timing plans were considered for analysis of signalized intersections. Detailed capacity and queue analysis reports under background (2025) conditions can be found in **Appendix D**.

The worst movement delay was reported for uncontrolled approaches at unsignalized intersections

As shown in **Table 2**, the background (2025) conditions capacity analysis revealed the following results:

Fairburn Road (SR 92) at Riverside Parkway

- During the AM and PM peak hours, all turning movements will continue to operate at LOS C or better apart for westbound left turn movement which operates at LOS E and F during the AM and PM peak hour respectively.
- The intersection will continue to operate sufficiently at an overall LOS C or better during both peak hours.

Riverside Parkway at Roberts Road

- During the AM and PM peak hours, all turning movements will continue to operate at LOS C or better.
- The intersection will continue to operate adequately with negligible delay during both peak hours.

Riverside Parkway at Thornton Road

- During the AM peak hour, the eastbound through, westbound left, and southbound left turn movements will continue to operate inadequately at **LOS F**. Additionally, the westbound through, northbound left, and southbound through movements operate at LOS E.
- During the PM peak hour, the westbound through and southbound left turn movements are projected to operate below the adopted LOS standard at **LOS F**. Additionally, the eastbound through, eastbound left, northbound left, and southbound through movements operate at LOS E.
- The remaining turn movements will continue to operate at LOS D or better during both peak hours.
- The intersection will operate insufficiently at an overall LOS E during the AM and PM peak hours.

5 Build Conditions

5.1 Trip Generation

A trip generation analysis was performed for the proposed development using the Institute of Transportation Engineers (ITE) Trip Generation Manual, 11th Edition. The resulting trip generation analysis is summarized in **Table 4**. ITE information sheets are provided in **Appendix E**.

Table 4: Trip Generation Analysis

Land Use Information	Project Trips			Equation Used ¹	In / Out Distribution
	Total	Inbound	Outbound		
160 - Data Center				1,657,000	SF
Daily	1,640	820	820	T = 0.99(X)	50% / 50%
AM Peak Hour	210	116	94	T = 0.13(X)-5.63	55% / 45%
PM Peak Hour	177	53	124	T = 0.11(X)-5.65	30% / 70%
Net New External Vehicle Trips					
Daily	1,640	820	820		
AM Peak Hour	210	116	94		
PM Peak Hour	177	53	124		

¹ Where: T = Trips; X = Density by Variable

Source: ITE Trip Generation Manual, 11th Edition

Vantage Date Center – DRI Report
Douglasville County, GA

The proposed development is anticipated to generate 1,640 net new daily vehicle trips (820 inbound and 820 outbound). The AM peak hour is anticipated to generate 210 net new vehicle trips (116 inbound and 94 outbound). The PM peak hour is anticipated to generate 177 net new vehicle trips (53 inbound and 124 outbound).

It should be noted that the trip generation is based on average trip rates and equations published in the ITE Trip Generation Manual. Typically, Vantage Data Centers generate 60 trips daily on all their data center sites. There was a discussion during the methodology meeting to collect counts at three of their sites to develop an average rate. Due to time constraints, we were unable to collect data. Hence the entire analysis is based on the ITE Trip Generation rates.

5.2 Trip Distribution

The trip distribution pattern used in the approved DRI study was maintained to accurately reflect prevailing travel patterns in the vicinity of the site and the surrounding transportation network. The estimated project trip distribution on the study intersections is presented in **Figure 8**. Project trips were then assigned to the study intersections. AM and PM peak hour project trips are displayed in **Figure 9**.

Vantage Date Center – DRI Report
 Douglasville County, GA

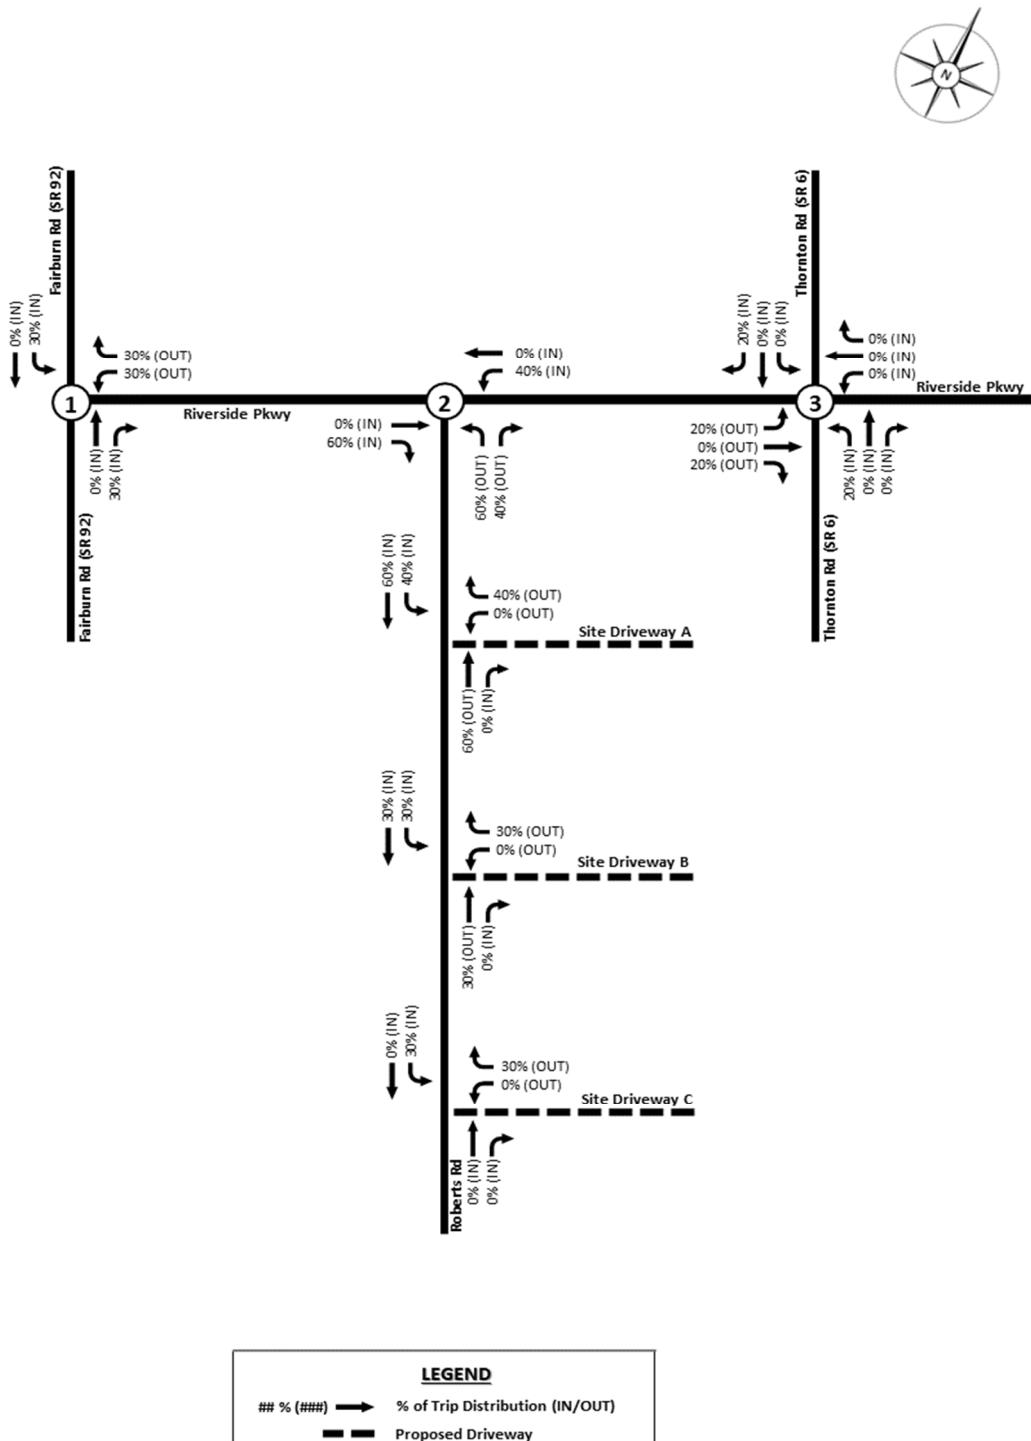

Figure 8: Project Trip Distribution

Vantage Date Center – DRI Report
 Douglasville County, GA

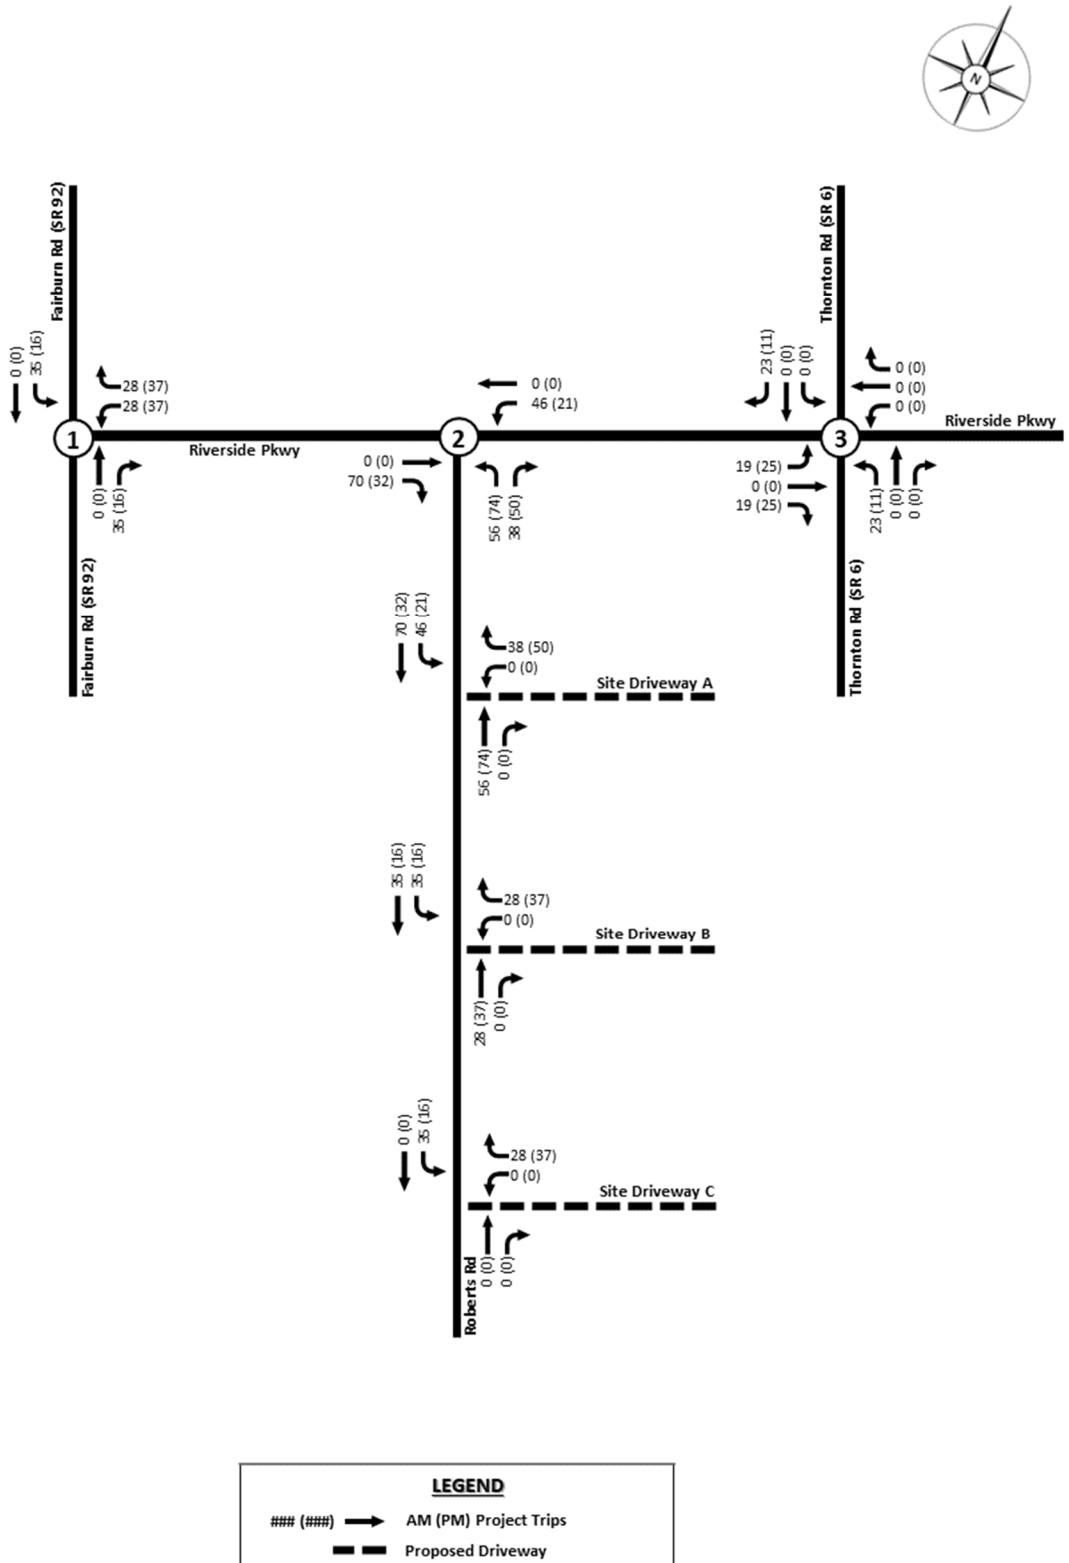

Figure 9: Assignment of Project Trips

5.3 Build Lane Geometry and Traffic Control

Lane geometry and traffic control under build (2025) conditions for the study intersections are illustrated in **Figure 10**. A right-in, right-out access to the site will be provided but will be used under emergency conditions only.

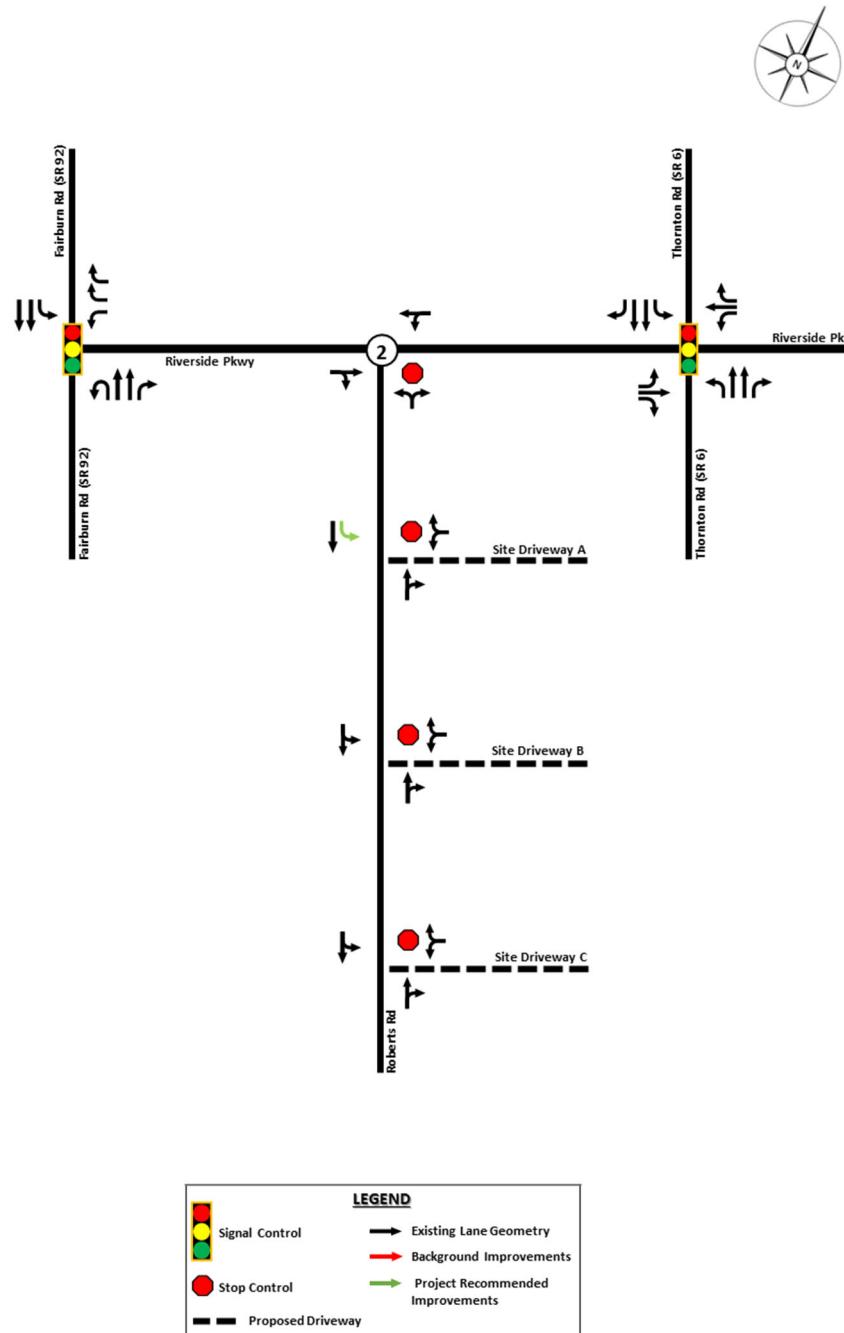

Figure 10: Build (2025) Lane Geometry and Traffic Control

5.4 Build Capacity Analysis

A capacity analysis for the study intersections was performed under build (2025) conditions based on the HCM 6's methodology, whenever applicable, during the AM and PM peak hours using Synchro 11. Build conditions represent future intersection geometrical layouts, future traffic control, and projected (2025) intersection vehicular turning movement volumes during the AM and PM peak hours. Projected (2025) intersection volumes were computed by applying the calculated annual growth rate to the existing (2023) turning movement volumes and then adding the project-generated directional trips. Projected build (2025) AM and PM peak hour vehicular turning movement volumes for the study intersections are presented in **Figure 11**.

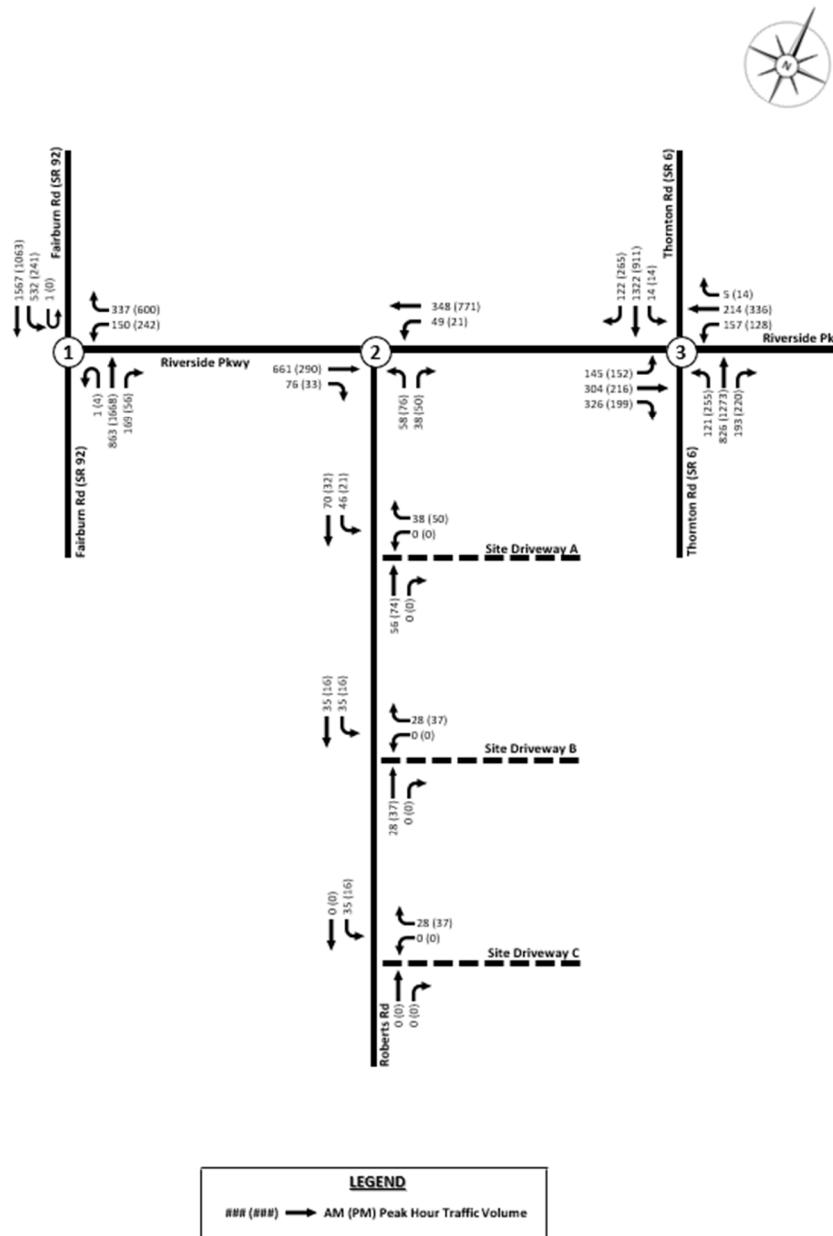

Figure 11: Build (2025) Traffic Volumes

Vantage Date Center – DRI Report
Douglasville County, GA

Capacity analysis results, including vehicular control delay, LOS at the approach and intersection levels, and 95th percentile queue lengths, are summarized in **Table 4**. Average vehicular delays are shown in seconds per vehicle. LOS is a grading system defined by the HCM where A is the best, and F is worst. Fully optimized signal timing plans were considered for analysis of signalized intersections. Detailed capacity and queue analysis reports under build (2025) conditions can be found in **Appendix D**.

The worst movement delay was reported for uncontrolled approaches at unsignalized intersections

As indicated in **Table 5**, the build (2024) conditions capacity analysis for revealed the following results:

Fairburn Road (SR 92) at Riverside Parkway

- During the AM and PM peak hours, all turning movements will operate at LOS D or better.
- The intersection will operate sufficiently at an overall LOS B during both peak hours.

Riverside Parkway at Roberts Road

- During the AM peak hour, the northbound turn movements are projected to operate at LOS E. The remaining turning movements are projected to operate at LOS D or better during both peak hours at the project buildout.
- The intersection will continue to operate adequately with negligible delay during both peak hours.

Riverside Parkway at Thornton Road

- During the AM peak hour, the eastbound through, westbound left, and northbound and southbound left turn movements will continue to operate inadequately at **LOS F**. Also, the westbound through movement is projected to operate below the adopted LOS standard at LOS E.
- During the PM peak hour, the westbound through, northbound and southbound left turn movements are projected to operate below the adopted LOS standard at **LOS F**.
- During the PM peak hour, the eastbound left, eastbound through, and westbound left turn movement will operate below the adopted LOS standard at LOS E.
- The remaining turn movements will continue to operate at LOS D or better during both peak hours.
- The intersection will continue to operate at an overall LOS D during the AM peak hour. During the PM peak hour, however, the intersection will operate adequately at **LOS F**.

Roberts Road at Site Driveway A

- During the AM and PM peak hours, all turning movements will operate at LOS A.
- The intersection will operate sufficiently with negligible delay during both peak hours.

Roberts Road at Site Driveway B

- During the AM and PM peak hours, all turning movements will operate at LOS A.
- The intersection will operate adequately with negligible delay during both peak hours.

Roberts Road at Site Driveway C

- During the AM and PM peak hours, all turning movements will operate at LOS A.
- The intersection will operate adequately with negligible delay during both peak hours.

5.5 Turn Lane Warrant Analysis

The development is proposed to be accessed via three (3) full access driveways on Roberts Road. The latter is a two-lane undivided, unpaved roadway with an average daily traffic (ADT) volume of 74 vehicles that leads to a water treatment plant and does not have a posted speed limit. A review of warrants for turn lanes was conducted on the proposed site access driveways in accordance with 2023 GDOT Regulations for Driveway and Encroachment Control to ensure smooth traffic flow, maintain capacity, and eliminate unnecessary delay to through traffic on Roberts Road during peak hours. If warranted, the

required total turn lane lengths will be calculated per Table 4-8 and Table 4-9 of 2023 GDOT Regulations for Driveway and Encroachment Control. A summary of turn lane warrant analysis for the proposed site access driveways is presented in **Table 6**. An excerpt from 2023 GDOT Regulations for Driveway and Encroachment Control is provided in **Appendix F**.

Table 6: Turn Lane Warrant Analysis

Location	Warrant For	# of Lanes	Speed Limit (mph)	AADT Category	Project RT/LT Volume (vpd)	Volume Threshold (vpd)	Warrant Met ?
Roberts Rd @ Site Driveway A	Right Turn Lane	2	35 MPH or Less	<6,000	0	200	No
Roberts Rd @ Site Driveway B	Right Turn Lane	2	35 MPH or Less	<6,000	0	200	No
Roberts Rd @ Site Driveway C	Right Turn Lane	2	35 MPH or Less	<6,000	0	200	No
Roberts Rd @ Site Driveway A	Left Turn Lane	2	35 MPH or Less	<6,000	328	300	Yes
Roberts Rd @ Site Driveway B	Left Turn Lane	2	35 MPH or Less	<6,000	246	300	No
Roberts Rd @ Site Driveway C	Left Turn Lane	2	35 MPH or Less	<6,000	246	300	No

5.5.1 Auxiliary Right Turn Lanes

The warrant analysis result shows that a northbound right turn lane is not warranted on Roberts Road at each of the three site driveways. For the eastbound right turning movement at the intersection of Riverside Parkway and Roberts Road a right turn lane is warranted. This right turn lane should be built to have a full width storage of 175 feet with a 100 feet taper. A westbound left turn lane is also warranted. This left turn lane should be built to have a full width storage of 235 feet with a 100 feet taper.

5.5.2 Auxiliary Left Turn Lanes

The warrant analysis result shows that a southbound left turn lane is warranted on Roberts Road at Site Driveway A. Based on an assumed posted speed limit of 25 mph, therefore, a southbound left turn deceleration lane of 85 feet with a 50-foot taper should be constructed on Roberts Road at Site Driveway A. Southbound left turn lanes are not warranted on Roberts Road at Site Driveway B and C.

5.5.3 Auxiliary Turn Lanes Summary

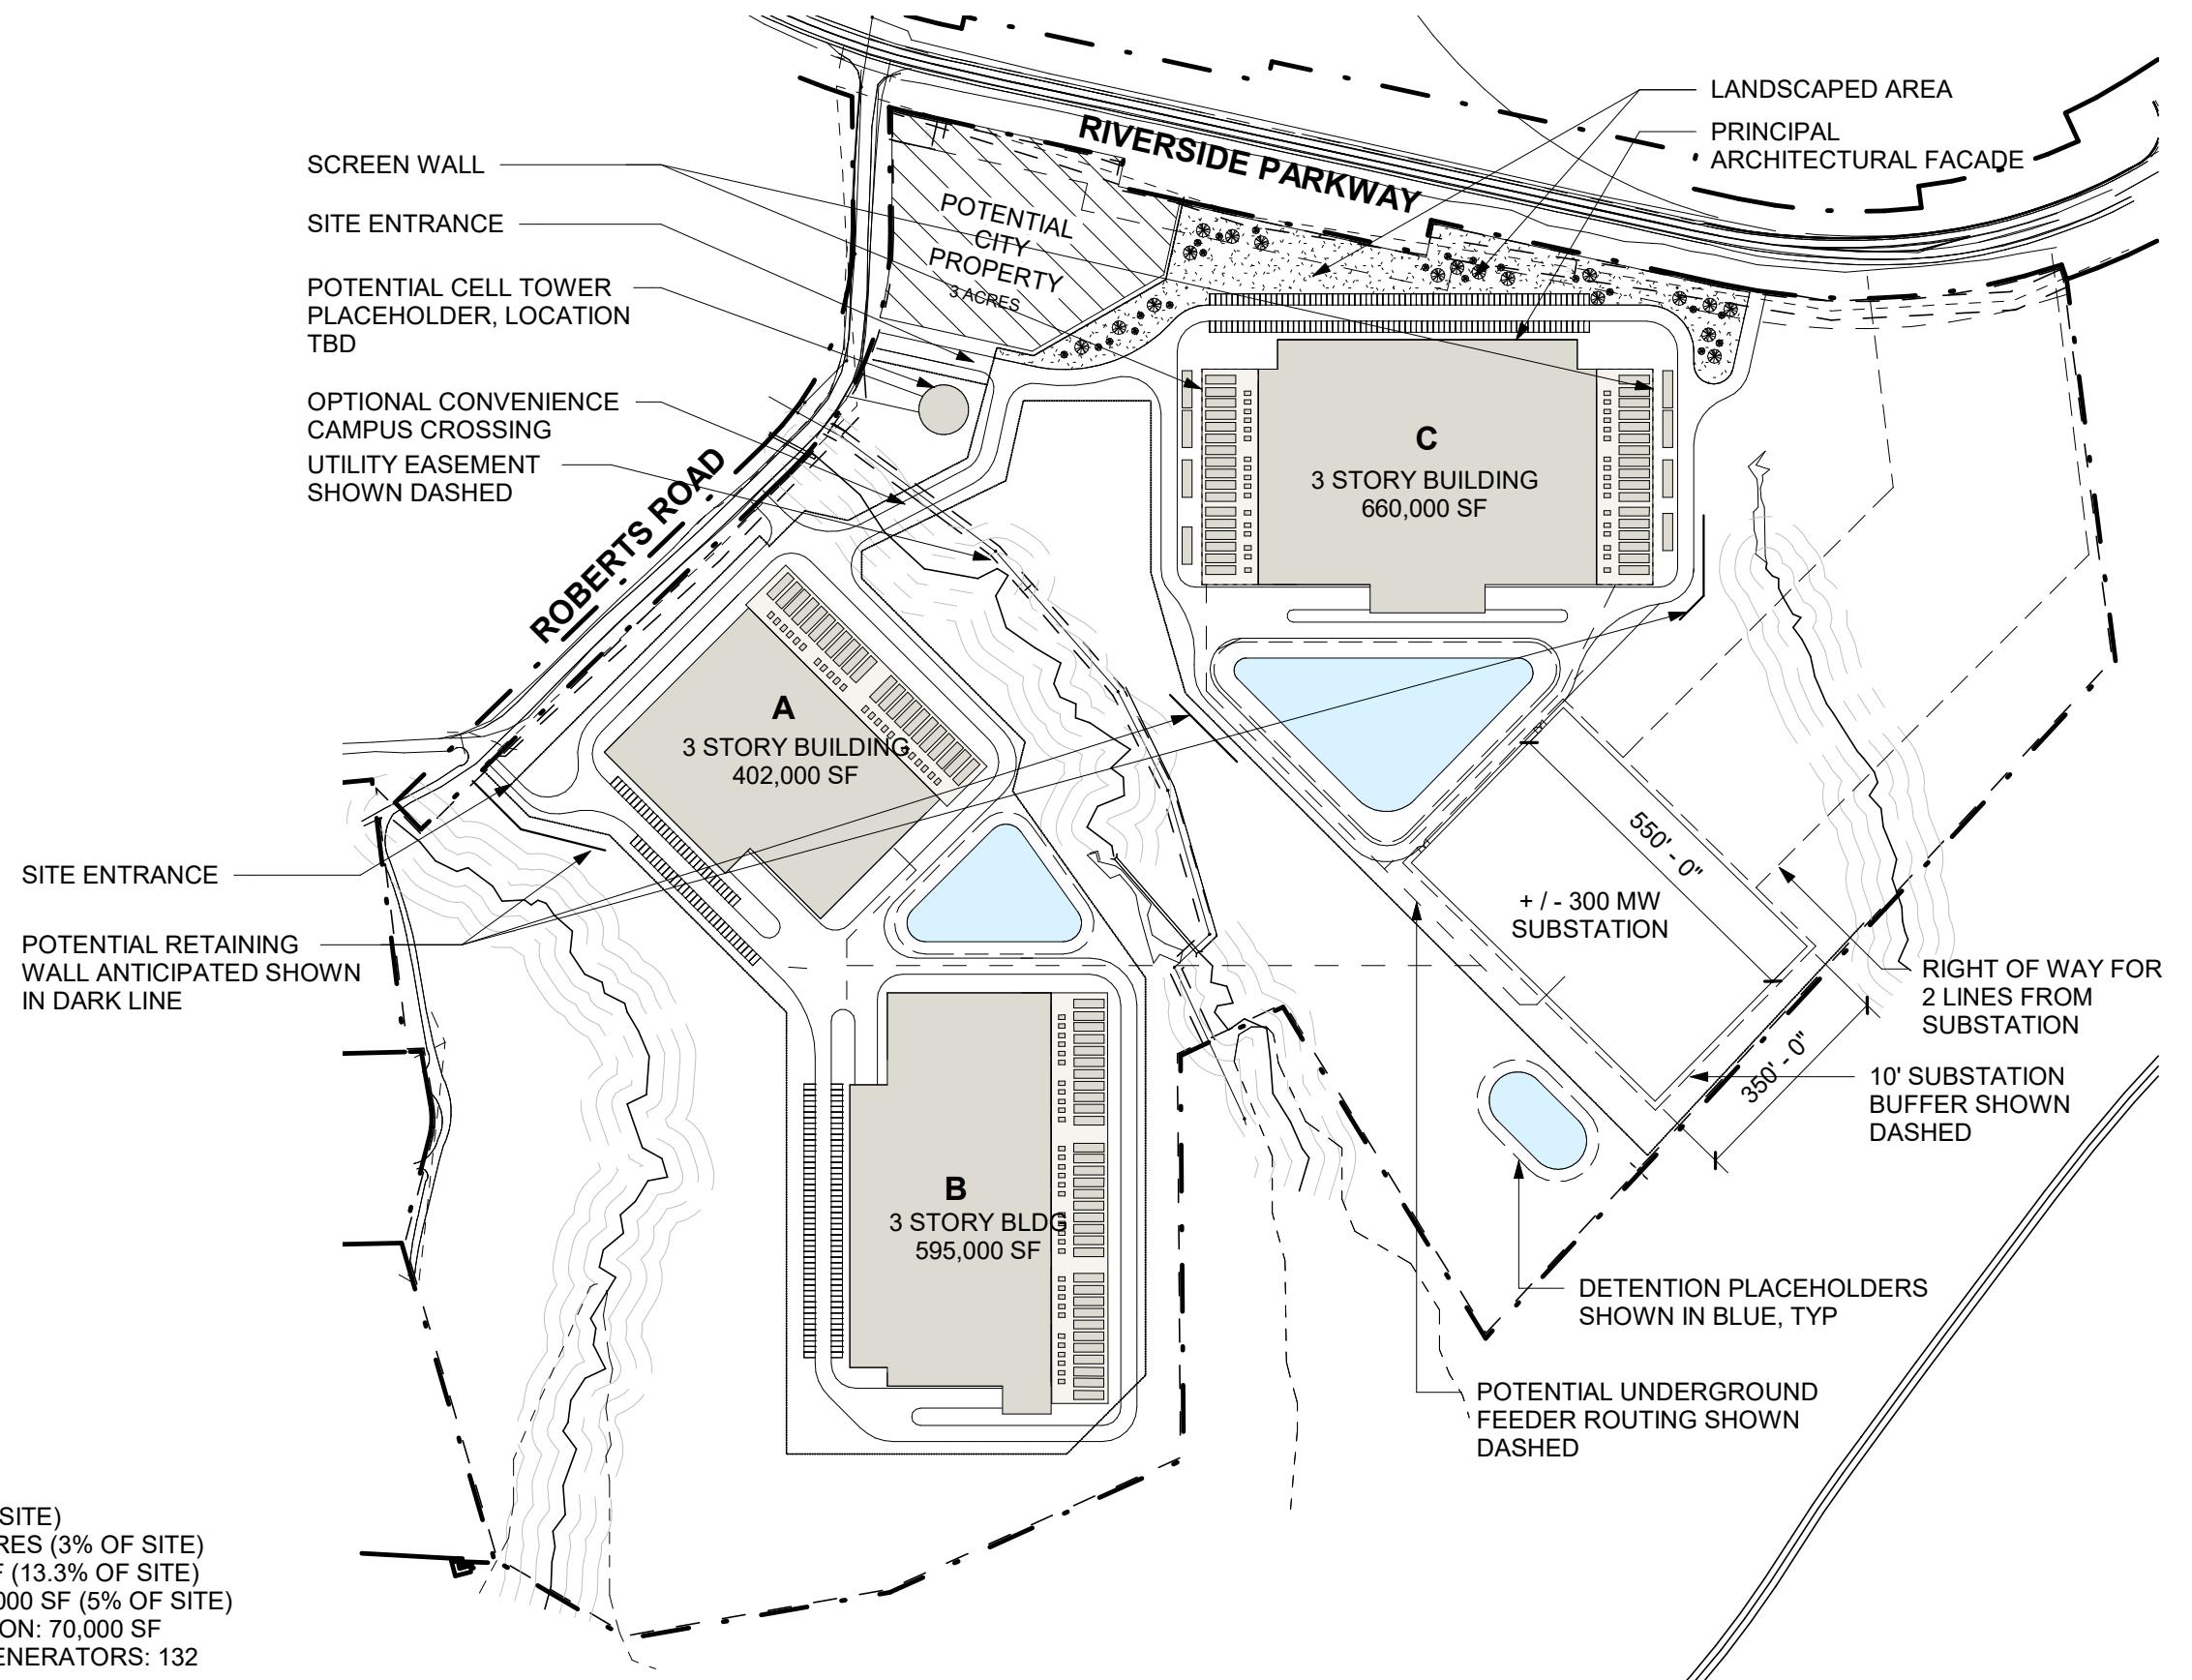

Roberts Road should be improved by installing a single southbound left turn lane of 85 feet with a 50-foot taper at Site Driveway A.

6 Conclusions and Recommendations

This DRI report was prepared to assess the impact of the proposed development of Vantage Date Center on the adjacent transportation network. The project site is located in the southeast quadrant of Riverside Parkway and Roberts Road in the City of Douglasville in Douglas County, GA. The project is composed of three three-story data center buildings totaling an area of 1,657,000 square feet with an anticipated buildout year of 2025. The analysis evaluated the development's impact on the study intersections within the project's influence area. The results of the analysis as documented herein are summarized below:

- Using the proposed development's square footage and the latest industry standard for trip generation, namely the ITE Trip Generation Manual 11th Edition, the proposed development is projected to generate 1,640 net new daily vehicle trips, of which 210 trips occur during the AM peak hour and 177 trips occur during the PM peak hour. This reference, however, estimates trips based on survey data for a particular lane use. It has been clearly observed that other data centers, owned and operated by the same development company across the U.S., generate much less trips as compared to estimates developed by the ITE Trip Generation Manual. More specific to Vantage Data Centers around the country, it has been observed that the data centers do not generate more than 60 vehicular trips per day. Due to shortage of time, an average trip rate for this site based on three other Vantage Data Centers was not possible. These data centers only expect employee trips. But the report details out analysis based on the ITE Trip Generation Manual prescribed rates.
- Except for the intersection of Thornton Road (SR 6) and Riverside Parkway, the study intersections are projected to operate at an adequate overall LOS at the project buildout.
- The intersection capacity analysis shows that the intersection of Thornton Road (SR 6) and Riverside under background conditions will operate at an overall LOS E during both peaks with a few turning movements operating at LOS F. The intersection is expected to operate at LOS F during the PM peak under build conditions. Similar to the existing and background conditions, certain individual turning movements are expected to operate at LOS F during the build conditions.
- The proposed three site access driveways are projected to operate at an adequate LOS at the project buildout.
- Based on the results of the traffic analysis, there is less than significant transportation impact due to the proposed project with minimal change to existing traffic patterns at the nearest significant intersections from the site access driveways.
- Roberts Road should be improved by installing a single southbound left turn lane of 85 feet with a 50-foot taper at Site Driveway A.
- An eastbound right turn lane should be built at the intersection of Riverside Parkway and Roberts Road to have a full width storage of 175 feet with a 100 feet taper. A westbound left turn lane is also warranted. This left turn lane should be built to have a full width storage of 235 feet with a 100 feet taper.

Appendix A: Preliminary Site Plan

SITE PLAN INFORMATION:

LOT SIZE: 95.121 ACRES
 ZONING TYPE: LIGHT INDUSTRIAL
 SUBSTATION: 4.4 ACRES (4.6% OF SITE)
 POTENTIAL CITY PROPERTY: 3 ACRES (3% OF SITE)
 BUILDING FOOTPRINTS: 552,000 SF (13.3% OF SITE)
 SERVICE YARD FOOTPRINTS: 210,000 SF (5% OF SITE)
 PRELIMINARY REQUIRED DETENTION: 70,000 SF
 NUMBER OF PLANNED BACKUP GENERATORS: 132

GA-B CONCEPTUAL SITE PLAN

HCM 6th LOS			B					

Notes

User approved pedestrian interval to be less than phase max green.

User approved ignoring U-Turning movement.

* HCM 6th computational engine requires equal clearance times for the phases crossing the barrier.

Intersection Summary

HCM 6th Ctrl Delay 57.7

HCM 6th LOS E

Notes

User approved pedestrian interval to be less than phase max green.

* HCM 6th computational engine requires equal clearance times for the phases crossing the barrier.

Unsignalized Delay for [NBR, EBR, WBR, SBR] is excluded from calculations of the approach delay and intersection delay.

Intersection Summary

HCM 6th Ctrl Delay	52.5
HCM 6th LOS	D

Notes

User approved pedestrian interval to be less than phase max green.

* HCM 6th computational engine requires equal clearance times for the phases crossing the barrier.

Unsignalized Delay for [NBR, EBR, WBR, SBR] is excluded from calculations of the approach delay and intersection delay.

Intersection Summary

HCM 6th Ctrl Delay	88.6
HCM 6th LOS	F

Notes

User approved pedestrian interval to be less than phase max green.

* HCM 6th computational engine requires equal clearance times for the phases crossing the barrier.

Unsignalized Delay for [NBR, EBR, WBR, SBR] is excluded from calculations of the approach delay and intersection delay.

Appendix E: ITE Trip Generation Sheets

Land Use: 160

Data Center

Description

A data center is a free-standing warehouse type of facility that is primarily used for off-site storage of computer systems and associated components including applications and secure data. Some data centers may include maintenance areas and a small office. Data centers may be occupied by single or multiple tenants. Data centers typically have a small number of employees and visitors.

Additional Data

For the two data sites with time-of-day data, the AM and PM peak hours for the sites were between 6:30 and 7:30 a.m. and 3:00 and 4:00 p.m., respectively.

The sites were surveyed in the 2010s in Illinois and Virginia.

Caution should be used when applying trip generation rates for data centers, as the database contains a small number of sites with limited data on the number of tenants and employees. To assist in the future analysis of this land use, it is important that this information be reported.

Appendix F: Turn Lane Warrant Standards

4.9 Auxiliary Turn Lanes

4.9.1 When Deceleration Lanes Are Required

The provisions of this section should generally apply to auxiliary lanes installed on the approach to an intersection that provide for deceleration and storage of vehicles waiting to turn right or left. Such lanes are always beneficial and will be required in conjunction with commercial driveway permits when projected traffic volumes exceed minimum levels as provided in the sections below.

All existing utilities which would be under new pavement or in auxiliary/deceleration lanes should be relocated before final grading and paving, and at no cost to DOT. Existing utilities which are found to be not in conflict with construction may be allowed if a Retention Request is processed by the utility owner and approved by the Department.

4.9.1.1 Minimum Requirements for Right Turn Deceleration Lanes

Right turn deceleration lanes must be constructed at no cost to the Department if the daily site generated Right Turn Volumes (RTV) based on ITE Trip Generation (assuming a reasonable distribution of entry volumes) meet or exceed the values shown in Table 4-6. Passing lane sections fall under the criteria for two or more lanes.

Posted Speed	2 Lane Routes		More than 2 Lanes on Main Road	
	AADT		AADT	
	< 6,000	>=6,000	<10,000	>=10,000
35 MPH or Less	200 RTV a day	100 RTV a day	200 RTV a day	100 RTV a day
40 to 50 MPH	150 RTV a day	75 RTV a day	150 RTV a day	75 RTV a day
55 to 60 MPH	100 RTV a day	50 RTV a day	100 RTV a day	50 RTV a day
>= 65 MPH	Always	Always	Always	Always

Table 4-6 Minimum Volumes Requiring Right Turn Lanes

In the event the District Traffic Engineer determines that field conditions or other factors indicate that it would be in the best interest of the Department, use the form in **Appendix F** to document a waiver for the deceleration lane requirement, the District Traffic Engineer must document the recommendations using the form in **Appendix F**. The recommendations shall be approved by the District Engineer and be attached to the Permit. The District Traffic Engineer may also require the addition of a Right Turn lane, even when the conditions in Table 4-6 are not met, if roadway geometry or field conditions indicate that the safety of the traveling public would be improved. The recommendation must be documented and approved by the District Traffic Engineer for inclusion with the Permit.

The R/W for auxiliary/deceleration lanes may be dedicated in fee simple to the Department for the Department to maintain or the applicant must sign an agreement with the Department to maintain the lane to the Department's standards and to hold harmless the Department in the event that section of roadway is identified in any liability action. A Limited Warranty Deed is not acceptable when R/W is donated to the Department. See section 2.5 for details regarding RW dedication procedures.

The pavement specifications for auxiliary/deceleration lanes must be Georgia DOT Standard Specifications for Construction of Roads and Bridges, or be as described and approved by the Chief Engineer in cases where a lesser design may be acceptable, or where a proposed project is expected to tie in.

4.9.1.2 Minimum Requirements for Left Turn Lanes

Left turn lanes must be constructed at no cost to the Department if the daily site generated Left Turn Volumes (LTV) based on ITE Trip Generation (assuming a reasonable distribution of entry volumes) meet or exceed the values shown in Table 4-7a **Condition 1**. If the LTVs are below the requirements for **Condition 1**, the applicant may be required to construct a Right Hand Passing Lane (see **Figure 4-7** if they meet the criteria in Table 4-7b **Condition 2**). The District Traffic Engineer will use engineering judgment to determine if the field conditions would allow construction of the Right Hand Passing Lane. Passing lane sections fall under the criteria for two or more lanes.

Condition 1

LEFT TURN REQUIREMENTS-FULL CONSTRUCTION				
Posted Speed	2 Lane Routes		More than 2 Lanes on Main Road	
	ADT		ADT	
	<6,000	≥6,000	<10,000	≥10,000
35 MPH or Less	300 LTV a day	200 LTV a day	400 LTV a day	300 LTV a day
40 to 50 MPH	250 LTV a day	175 LTV a day	325 LTV a day	250 LTV a day
≥ 55 MPH	200 LTV a day	150 LTV a day	250 LTV a day	200 LTV a day

Table 4-7a Minimum Volumes Requiring Left Turn Lanes

Condition 2

LEFT TURN REQUIREMENTS w/Right Hand Passing Lane Option		
Posted Speed	2 Lane Routes only	
	ADT	
	<4,000	≥4,000
35 MPH or Less	200 LTV a day	125 LTV a day
40 to 45 MPH	100 LTV a day	75 LTV a day
50 to 55 MPH	75 LTV a day	50 LTV a day

Table 4-7b Minimum Volumes Requiring Right Hand Passing Lanes

SPEED (MPH)	FULL WIDTH STORAGE, FT.	TAPER, FT.
25	50	50
30	75	50
35	100	50
40	150	50
45	175	100
50	225	100
55	250	100
60	300	100
65	350	100

Table 4-8 Minimum Right Turn Deceleration Lengths

When traffic studies are conducted, the length of full-width lane needed for storage should be determined. If the length of full-width storage is greater than the length of full-width storage shown in Table 4-8, the longer length should be provided.

At signalized intersections, the amount of storage for both right and left turns can be based on the number of vehicles arriving during 1.5 signal cycles.

For unsignalized intersections, left turn storage should accommodate vehicles arriving during a two-minute period. Minimal storage is required for right turn lanes utilizing yield control at unsignalized intersections.

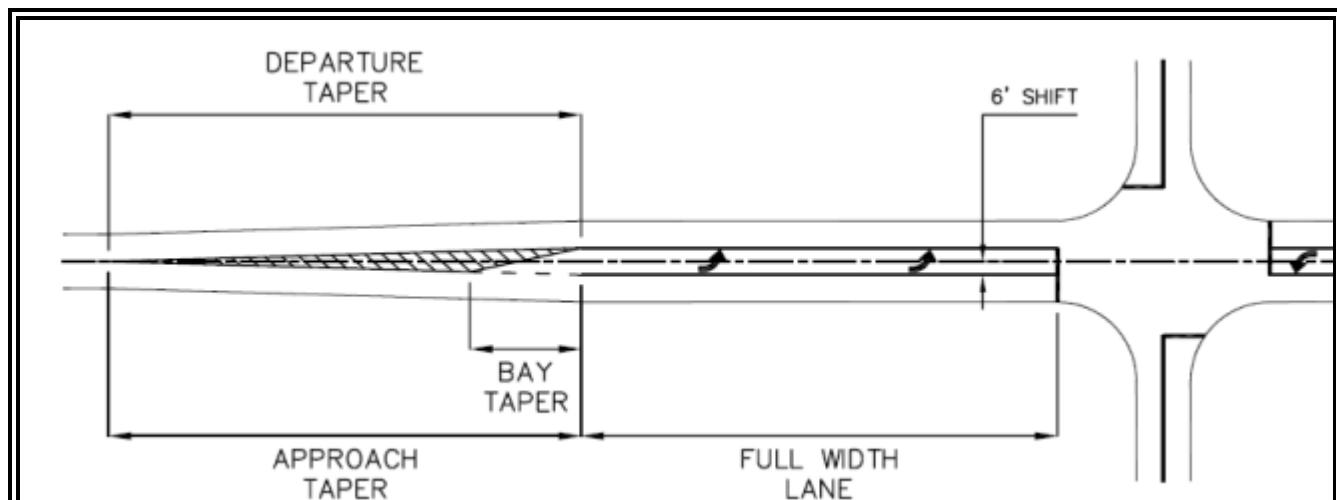

4.9.3 Acceleration Lanes

Acceleration lanes are generally not provided on low speed highways. Acceleration lanes may be required at locations where grade, sight distance or traffic is such that the Department determines they are needed. When operating speeds on the highway are 55 MPH and above, full-width acceleration lanes designed to meet the AASHTO minimum length should be considered.

4.9.4 Left Turn Lane Design

The design of left turn lanes should consider the intended function and the characteristics of the highway. In many cases, it is necessary to widen the existing roadway to introduce the left turn lane. In most cases vehicles approaching the turn lane are shifted to the right (especially when using symmetrical widening). The left turning traffic is then shifted back into the lane. Through traffic is returned to its original lane beyond the intersection. When the highway has a median that is at least 20 feet wide, the left turn lane can typically be developed out of the median, avoiding the need for transitions.

The basic design elements of left turn lanes are illustrated in Table 4-9. This example shows symmetrical widening, which basically requires the through traffic on each side to shift by one half of the lane width. Some circumstances may dictate that all widening be achieved on one side, which requires a full lane shift for through traffic on the side where the additional width is developed. Table 4-9 provides guidelines for selecting the proper length of approach taper. When shifts are not 6' or 12', use table 4-9 bay taper.

The diagram illustrates a left turn lane design. It features a 'DEPARTURE TAPER' at the top where a vehicle turns from a straight path into a curved lane. Below it is a 'BAY TAPER' which leads into a 'FULL WIDTH LANE'. A '6' SHIFT' is indicated by a vertical line and arrows, showing the lateral movement of the lane markings. The diagram also shows the 'APPROACH TAPER' leading up to the turn point.

POSTED SPEED LIMIT, MPH	APPROACH AND DEPARTURE TAPER, FT.		BAY TAPER, FT.	FULL WIDTH STORAGE, FT
	6' Shift	12' Shift		
25	65	130	50	85
30	90	180	50	135
35	125	250	50	160
40	160	320	50	210
45	270	540	100	235
50	300	600	100	285
55	330	660	100	310
60	360	720	100	360
65	390	780	100	410

Table 4-9 Minimum Design Elements of Left Turn Lanes

The example shown in Table 4-9 has straight-line tapers. These are acceptable but other designs may also be used, including the following: partial tangent tapers, symmetrical reverse curve, and asymmetrical reverse curve. See latest edition of AASHTO Green Book for details.

The required length of full-width storage shall be based on storage length and a deceleration length that allows vehicles to safely decelerate without a possible conflict with another vehicle (Refer to [Construction Detail M-3A](#)). This should be determined in the traffic study. The amount of storage is dependent on the type of traffic control in effect. For signalized intersections, the storage should be sufficient to accommodate the number of vehicles arriving during 1.5 signal cycles, using peak hour volumes. At stop-controlled intersections, the storage is typically based on the number of vehicles arriving during a two-minute period within the peak hour.
